Underground Infrastructure of Urban Areas 4 Cezary Madryas, 2017 These proceedings contain the papers presented at the 13th conference on Underground Infrastructure of Urban Areas UIUA 2017 The aim of the conference is to create a forum in order to develop an exchange of experiences and provoke a discussion on the topics related to building of tunnels and underground infrastructure in the cities These include geotechnical tests town planning underground infrastructure such as tunnels traffic and railway tunnels and underground water and sewage ducts garages and subways as well as the possibilities of using an underground space associated with town planning and modernization of cities The conference organizers wish to involve a wide body of people from different sectors such as scientists investors designers contractors and students The subject matter of conference is timely due to a current need for adjusting underground infrastructures to current standards and requirements The impact of these structures on the environment and the principles of sustainable development have to be considered Provided by publisher Underground Engineering for Sustainable Urban Development National Research Council, Division on Earth and Life Studies, Board on Earth Sciences and Resources, Committee on Geological and Geotechnical Engineering, Committee on Underground Engineering for Sustainable Development, 2013-02-26 For thousands of years the underground has provided humans refuge useful resources physical support for surface structures and a place for spiritual or artistic expression More recently many urban services have been placed underground Over this time humans have rarely considered how underground space can contribute to or be engineered to maximize its contribution to the sustainability of society As human activities begin to change the planet and

population struggle to maintain satisfactory standards of living placing new infrastructure and related facilities underground may be the most successful way to encourage or support the redirection of urban development into sustainable patterns Well maintained resilient and adequately performing underground infrastructure therefore becomes an essential part of sustainability but much remains to be learned about improving the sustainability of underground infrastructure itself At the request of the National Science Foundation NSF the National Research Council NRC conducted a study to consider sustainable underground development in the urban environment to identify research needed to maximize opportunities for using underground space and to enhance understanding among the public and technical communities of the role of underground engineering in urban sustainability Underground Engineering for Sustainable Urban Development explains the findings of researchers and practitioners with expertise in geotechnical engineering underground design and construction trenchless technologies risk assessment visualization techniques for geotechnical applications sustainable infrastructure development life cycle assessment infrastructure policy and planning and fire prevention safety and ventilation in the underground This report is intended to inform a future research track and will be of interest to a broad audience including those in the private and public sectors engaged in urban and facility planning and design underground construction and safety and security

Urban Subterranean Space Junghwa Lee, 2018 The global trend of urbanization requires an increased demand for reliable infrastructure in urban land The lack of buildable space in urban areas has been resolved traditionally by skyscrapers and sometimes the location of new development is shifted to the outside of the central city due to the lower density and property values However longer distance between the traditional city center and the new developed area requires additional infrastructure to support the networks Urbanization allows economic and social development as well as an opportunity to lessen the impact of consumption and production on the environment However the urbanization and denser city plans do not always create the successful sustainable urban development The key function of a city is to enable exchange interaction and the combination and recombination of people and ideas Although denser cities are more productive innovative and energy efficient when buildings become so massive this key function of the city can disappear Florida While skyscrapers can be the significant element of the big cities it can be intriguing to consider buildings downwards instead of upwards because it saves ground space by providing extra spaces as well as bringing visibility back to the pedestrian level This thesis will argue how necessary it is to develop the subterranean space within the urban contexts which will establish an alternative solution for urban design problems This research will create a design framework for subterranean public space which leverages existing underground spaces such as subway stations in New York City to create a space that contributes to its aboveground environment that is currently neglecting a significant relationship with above ground spaces The result of this thesis is to design a subterranean public space that provides an extra space with an access to multiple services Abstract
