

Understanding Alzheimer's Disease

The most common form of dementia is Alzheimer's Disease (AD), a slowly progressive disorder that destroys the neurons and communication pathways of the brain. It is the seventh leading cause of death in adults in the U.S., and it is perhaps the most devastating chronic disease for patients and their families.

The Aging Brain and Dementia

As we age, the brain undergoes many changes, with certain neurons lost to old age and new ones being formed. However, the overall number of neurons in the brain remains relatively stable. The brain's ability to adapt and compensate for these changes is called "neuroplasticity." The ability of the brain to adapt and compensate for these changes is called "neuroplasticity."

Risk Factors

- Age: AD affects only those aged 65 and older, with the risk increasing with age.
- Family History: Having a family history of AD increases the risk of developing the disease.
- Genetics: Certain genes, such as the APOE ε4 gene, increase the risk of developing AD.
- Head Trauma: A history of head trauma, such as from a fall or car accident, increases the risk of developing AD.
- Diagnosis: AD is diagnosed by a doctor who examines the patient's medical history, performs a physical exam, and conducts cognitive tests.

Affected Areas of the Brain

Alzheimer's Disease affects various areas of the brain, including the hippocampus, amygdala, and cerebral cortex. The disease causes the loss of neurons and the formation of amyloid plaques and neurofibrillary tangles.

Physical Changes in the Brain

Physical Changes in the Brain

As Alzheimer's Disease progresses, the brain undergoes significant physical changes. The brain's volume decreases, and the neurons become smaller. The brain also loses its ability to produce and use neurotransmitters, which are chemicals that help the brain communicate.

Neuronal Cellular Structural Involvement in Alzheimer's Disease

Lyketsos, 2016-09-14 This e book focuses primarily on the role of the fornix as a functional prognostic and diagnostic marker of Alzheimer's disease AD and the application of such a marker in clinical practice Researchers have long been focused on the cortical pathology of AD since the most important pathologic features are the senile plaques found in the cortex and the neurofibrillary tangles and neuronal loss that start from the entorhinal cortex and the hippocampus In addition to gray matter structures histopathological studies indicate that the white matter is also altered in AD The fornix is a white matter bundle that constitutes a core element of the limbic circuits and is one of the most important anatomical structures related to memory The fornices originate from the bilateral hippocampi merge at the midline of the brain again divide into the left and right side and then into the precommissural and the postcommissural fibers and terminate at the septal nuclei nucleus accumbens precommissural fornix and hypothalamus postcommissural fornix These functional and anatomical features of the fornix have naturally captured researchers attention as possible diagnostic and prognostic markers of AD Growing evidence indicates that the alterations seen in the fornix are potentially a good marker with which to predict future conversion from mild cognitive impairment to AD and even from a cognitively normal state to AD The degree of alteration is correlated with the degree of memory impairment indicating the potential for the use of the fornix as a functional marker Moreover there have been attempts to stimulate the fornix to recover the cognitive function lost with AD Our goal is to provide information about the status of current research and to facilitate further scientific and clinical advancement in this topic *Proceedings of the National Academy of Sciences of the United States of America* National Academy of Sciences (U.S.), 2000 International Bibliography of Alzheimer's Disease and Senile Dementias, 1976-1985 ,1986 Lists 2 739 entries to literature published between 1976 1985 Also contains foreign language titles Arranged under 28 topics ranging from behavioral biology through urinary system and external secretions Entries give titles keywords author's journal source original language and volume number and reference number to original cite in Biological abstracts or Biological abstracts RRM Author and subject indexes *Journal Canadien Des Sciences Neurologiques* ,1986 **Sleep**
