Growth Factor-Beta in Cancer Therapy, Volume I Sonia B. Jakowlew, 2010-01-01 Transforming Growth Factor β in Cancer Therapy Volume I Basic and Clinical Biology The present volume brings together a wealth of information that is fundamental to understanding the role of TGF in the pathogenesis prevention and treatment of cancer It is not even 25 years since TGF was first isolated and characterized as a dimeric peptide from both human and bovine sources 1 3 but the entire field of TGF research has grown and expanded so that it is now a central theme in all of cell biology There is almost no tissue or organ in the mammalian body in which TGF does not play a central role in embryonic differentiation or in adult function and furthermore malfunction of the normal physiology of TGF can have disastrous consequences in almost all of these sites

Therefore the present comprehensive review of so many aspects of TGF function is a most welcome attempt to bring together a huge body of experimental data that is of the utmost importance in the field of oncology Drug Repurposing in Cancer Therapy Kenneth K.W. Organelle and Molecular Targeting Lara Scheherazade Milane, Mansoor M. Amiji, 2021-12-27 We have surpassed the omics era and are truly in the Age of Molecular Therapeutics The fast paced development of SARS CoV 2 vaccines such as the mRNA vaccines encoding the viral spike protein demonstrated the need for and capability of molecular therapy and nanotechnology based solutions for drug delivery In record speed the SARS CoV 2 viral RNA genome was sequenced and shared with the scientific community allowing the rapid design of molecular therapeutics The mRNA vaccines exploit the host cell endoplasmic reticulum to produce viral spike proteins for antigen presentation and recognition by the innate and adaptive immune system Lipid nanoparticles enable the delivery of the fragile degradation sensitive nucleic acid payloads Molecular based therapeutics and nanotechnology solutions continue to drive the scientific and medical response to the COVID 19 pandemic as new mRNA DNA and protein based vaccines are developed and approved and the emergency use approved vaccines are rapidly manufactured and distributed throughout the globe The need for molecular therapies and drug delivery solutions is clear and as these therapies progress and become more specialized there will be important advancements in organelle targeting For example using organelle targeting to direct lipid nanoparticles with mRNA payloads to the endoplasmic reticulum would increase the efficacy of mRNA vaccines reducing the required dose and therefore the biomanufacturing demand Likewise improving the delivery of DNA therapeutics to the nucleus would improve efficacy

Organelles and molecules have always been drug targets but until recently we have not had the tools or capability to design and develop such highly specific therapeutics. Organelle targeting has far reaching implications. For example mitochondria are central to both energy production and intrinsic apoptosis. Effectively targeting and manipulating mitochondria has therapeutic applications for diseases such as myopathies, cancer, neurodegeneration, progerias, diabetes, and the natural aging process. The SARS CoV 2 vaccines that exploit the endoplasmic reticulum for mRNA vaccines and the nucleic translational process. DNA vaccines attest to the need for organelle and molecular therapeutics. This book covers the status, demand, and future of organelle and molecularly targeted therapeutics that are critical to the advancement of modern medicine. Organelle and molecular targeting is the drug design and drug delivery approach of today, and the future understanding of this approach is essential for students, scientists, and clinicians contributing to modern medicine.

In their outline and discussion of the use of novel formulation technologies including synthetic polymers and biomaterials for prolonged or sustained drug release to achieve potentially greater therapeutic effect, they profile those technologies that have resulted in a number of approved and late stage clinical products.

Sensitization of Cancer Cells for Chemo/Immuno/Radio-therapy Benjamin Bonavida, 2008-07-31. Cancer chemotherapy can be traced back to the 1940s and since then the world has witnessed the discovery and the important application of several new drugs. The successes of combination chemotherapy suggested that all cancers can be treated provided that the correct combination of drugs at the correct doses and correct intervals are established. However, with time tumor cells develop mechanisms of resistance to apoptosis and no longer respond to the majority of cytotoxic therapies. Sensitization of Cancer Cells for Chemo/Immuno/Radio therapy edited by Benjamin Bonavida reviews novel approaches developed to reverse tumor cell resistance to chemo/immuno/radio therapy and the use of various sensitizing agents in combination with various cytotoxics. Such sensitizing agents target gene products that regulate resistance and therefore identify novel targets for drug development. This book also introduces several of the current approaches that have been developed by established investigators in the field that are aimed at overcoming resistance. This book is the first that compiles studies on tumor cell sensitization and is useful for students, scientists, clinicians, and pharmaceutical companies.
