Torque Control Of A Separate Winding Excitation Dc Motor For A Dynamometer:

Torque Control of a Separate Excitation DC Motor for a Dynamometer Jonathan R. Derges, 2010 In this thesis the theory behind a separate winding excitation direct current DC motor and profile of the motor's torque versus rotor speed is studied. The torque versus rotor speed profile results are predictably linear at a given armature voltage. Output torque of a separate winding excitation DC motor is proportional to the armature current. From this theory a program was written in Simulink with Xilinx embedded software to enable a user to command the DC motor torque through a Graphical User Interface GUI. The command is then converted to control armature current through a Field Programmable Gate Array (FPGA) to the DC motor. The armature current level is maintained through a programmed Proportional Integral (PI) Controller to keep output torque constant regardless of armature voltage and rotor speed. This result is a way to command constant output torque to a DC motor.
