Switching Mode Circuit Analysis and Design: Innovative Methodology by Novel Solitary Electromagnetic Wave Theory Hirokazu Tohya, 2013-09-17 I joined NEC in 1968 and was assigned to the circuit development department of the computer division My first work was the circuit design of the switching mode power supply SMPS for the mainframe of the computer system My job area was expanded to development of the design rule and to standardization of all over the electric and electronics parts for the non logic circuit Non logic circuit was categorized to except the gate array which forms the logic circuit of the mainframe The experiment of SMPS was considered to be dangerousness and no one wanted to design Therefore my development of the power supply system PSS including the circuit design of SMPS was continued The electric current of the mainframe and the supercomputer was reached to several thousand amperes The critical problem of PSS was the heat dissipation and the electromagnetic interference EMI against the logic circuit In 1992 the full scale R D of EMC became necessary hastily I was nominated and transferred to the chief managing researcher of the established EMC engineering center in NEC Laboratories I had believed that the switching mode circuit SMC including the digital circuit and SMPS circuit will be improved greatly if the EMC problem is solved However the deep R D was difficult because the actual fruits in every year were required strongly Therefore his knowledge of the science concerning EMC was not deepened enough However I could understand the actual status of technologies of the electronics and electrics widely and the basic knowledge about how to approach the science as well as R D could be learned During this time I completed PhD course and received the PhD degree from Kyushu University lectured in Kyushu University and Tohoku University for one year each and executed several national projects by the cooperation of his colleague in NEC and of the supporters in the industrial society and academia These are considered to be my best harvest in NEC Laboratories I had decided to continue R D for solving EMC problem of SMC after his retirement and to try the commercialization of the fruit of R D I established ICAST which is the abbreviation of the innovative circuit and system technologies in 2005 The solitary electromagnetic SEMW theory was advocated and the novel technologies including the low impedance lossy line LILL and the matched impedance lossy line MILL were invented based on the SEMW theory Two purposes exist in this eBook The first is to be validated the SEMW theory by the academia and the industrial society The second is the contribution to the growth of the industry in the world by the technologies of LILL and MILL

Development of Field Propagation Model for Urban Area Purnima K Sharma, Dinesh Sharma, R.K. Singh, 2017-04 Wireless communication is one of the most dynamic and vibrant areas of technology development in the communication field today It has been found that severe climatic conditions disturb the propagation of electromagnetic signals at higher frequencies greater than 30 MHz The disturbance is mainly due to molecular absorption by oxygen for frequencies ranging between 60 and 118 GHz and due to water vapour in 22 183 and 325 GHz bands Rain and fog has the most significant impact since the size of the rain drops is of the order of the wavelength of the transmitted signal This results

in energy absorption by the rain drops themselves and as a secondary effect energy is scattered by the drops The frequency selective absorption characteristics of the atmosphere can be approximated by a transfer function In most of the practical channels when the signal propagates through the atmosphere the effect of many factors on the signal has to be considered along with the free space propagation channel assumption The main objective of this study is therefore to find out whether and how the different climatic conditions are influencing radio wave propagation in GSM frequency bands in general and in Narnaul Haryana India in particular To carry out this investigation the records of radio wave propagation along with path loss during different climatic conditions have been analyzed On the strength of these analyses a propagation path loss model has been developed by proposing suitable correction factors due to different climatic conditions The validation of this developed path loss model has been verified by taking reference models and by applying practically in different urban areas The effect of these climatic conditions on the link budget has also been analyzed

Design for Electromagnetic Compatibility--In a Nutshell Reto B.
