Thermal Quantum Field Theory And Perturbative Non Equilibrium Dynamics Springer Theses:

Thermal Quantum Field Theory and Perturbative Non-Equilibrium Dynamics Peter Millington, 2013-10-29 The author develops a new perturbative formalism of non equilibrium thermal quantum field theory for non homogeneous backgrounds As a result of this formulation the author is able to show how so called pinch singularities can be removed without resorting to ad hoc prescriptions or effective resummations of absorptive effects Thus the author arrives at a diagrammatic approach to non equilibrium field theory built from modified Feynman rules that are manifestly time dependent from tree level This new formulation provides an alternative framework in which to derive master time evolution equations for physically meaningful particle number densities which are valid to all orders in perturbation theory and to all orders in gradient expansion Once truncated in a loop wise sense these evolution equations capture non equilibrium dynamics on all time scales systematically describing energy violating processes and the non Markovian evolution of memory effects

Fluctuations and Non-Equilibrium Phenomena in Strongly-Correlated Ultracold Atoms Kazuma Nagao, 2020-08-25 This book discusses non equilibrium quantum many body dynamics recently explored in an analog quantum simulator of strongly correlated ultracold atoms The first part presents a field theoretical analysis of the experimental observability of the Higgs amplitude mode that emerges as a relativistic collective excitation near a quantum phase transition of superfluid Bose gases in an optical lattice potential The author presents the dynamical susceptibilities to external driving of the microscopic parameters taking into account a leading order perturbative correction from quantum and thermal fluctuations and shows clear signatures of the Higgs mode in these observables This is the first result that strongly supports the stability of the Higgs mode in three dimensional optical lattices even in the presence of a spatially inhomogeneous confinement potential and paves the way for desktop observations of the Higgs mode In the second part the author applies the semi classical truncated Wigner approximation TWA to far from equilibrium quantum dynamics Specifically he considers the recent experiments on quantum quench dynamics in a Bose Hubbard quantum simulator A direct comparison shows remarkable agreement between the numerical results from TWA and the experimental data This result clearly indicates the potential of such a semi classical approach in reliably simulating many body systems using classical computers The book also includes several chapters providing comprehensive reviews of the recent studies on cold atomic quantum simulation and various theoretical methods including the Schwinger boson approach in strongly correlated systems and the phase space semi classical method for far from equilibrium quantum dynamics These chapters are highly recommended to students and young researchers who are interested in semi classical approaches in non equilibrium quantum dynamics

Statistical Approach to Quantum Field Theory Andreas Wipf, 2021-10-25 This new expanded second edition has been totally revised and corrected The reader finds two complete new chapters One covers the exact solution of the finite temperature Schwinger model with periodic boundary conditions This simple model supports instanton

solutions similarly as QCD and allows for a detailed discussion of topological sectors in gauge theories the anomaly induced breaking of chiral symmetry and the intriguing role of fermionic zero modes The other new chapter is devoted to interacting fermions at finite fermion density and finite temperature Such low dimensional models are used to describe long energy properties of Dirac type materials in condensed matter physics The large N solutions of the Gross Neveu Nambu Jona Lasinio and Thirring models are presented in great detail where N denotes the number of fermion flavors Towards the end of the book corrections to the large N solution and simulation results of a finite number of fermion flavors are presented Further problems are added at the end of each chapter in order to guide the reader to a deeper understanding of the presented topics This book is meant for advanced students and young researchers who want to acquire the necessary tools and experience to produce research results in the statistical approach to Quantum Field Theory Physics Briefs ,1993 **Mathematical**

Keywords *Probing Non-Equilibrium Dynamics in Two-Dimensional Quantum Gases* Cheng-An Chen,2022-10-11 This thesis explores the physics of non equilibrium quantum dynamics in homogeneous two dimensional 2D quantum gases Ultracold quantum gases driven out of equilibrium have been prominent platforms for studying quantum many body physics However probing non equilibrium dynamics in conventionally trapped inhomogeneous atomic quantum gases has been a challenging task because coexisting mass transport and spreading of quantum correlations often complicate experimental analyses In this work the author solves this technical hurdle by producing ultracold cesium atoms in a quasi 2D optical box potential The exquisite optical trap allows one to remove density inhomogeneity in a degenerate quantum gas and control its

dimensionality The author also details the development of a high resolution in situ imaging technique to monitor the evolution of collective excitations and quantum transport down to atomic shot noise and at the length scale of elementary collective excitations Meanwhile tunable Feshbach resonances in ultracold cesium atoms permit precise and dynamical control of interactions with high temporal and even spatial resolutions By employing these state of the art techniques the author performed interaction quenches to control the generation and evolution of quasiparticles in quantum gases presenting the first direct measurement of quantum entanglement between interaction quench generated quasiparticle pairs in an atomic superfluid Quenching to attractive interactions this work shows stimulated emission of quasiparticles leading to amplified density waves and fragmentation forming 2D matter wave Townes solitons that were previously considered impossible to form in equilibrium due to their instability This thesis unveils a set of scale invariant and universal quench dynamics and provides unprecedented tools to explore quantum entanglement transport in a homogenous quantum gas

equations of quantum mechanics let alone those of quantum field theory are sufficiently complex to solve that various approximation schemes are both welcome and desirable In applications to quantum field theory renormalized perturbation theory has long been the predominant calculational tool and it has even tended to shape the entire conceptual outlook on such problems as well However the apparently irreconcilable conflict between strong interaction physics and perturbation theoretic calculations has given way in the past few years to some fairly revolutionary at least for field theory modes of formulation and calculation The fires of this revolution have been fed by exact solutions of special classical systems 1 notably the sine Gordon equation and an appreciation of the relevance of classical solutions of nonlinear systems as starting points in quantum analyses 2 The soliton solutions of the classical sine Gordon equation exhibit extraordinary stability under scattering but this feature is not essential for their utility in quantum studies Consequently broad studies have been made of nonlinear systems that exhibit localized persistent solutions which have also frequently been termed solitons or solitary waves or kinks as well 31 Solitons that have their origin in conventional symmetries and conserved currents and thus are topological in origin have been discussed 4 along with those that arise from asymptotic properties of the solution as in the sine Gordon model and thus are topological in origin **Nonequilibrium Quantum-field Dynamics and Off-shell**
