Wind Turbine Aerodynamics and Vorticity-Based Methods Emmanuel Branlard, 2017-04-05 The book introduces the fundamentals of fluid mechanics momentum theories vortex theories and vortex methods necessary for the study of rotors aerodynamics and wind turbines aerodynamics in particular Rotor theories are presented in a great level of details at the beginning of the book These theories include the blade element theory the Kutta Joukowski theory the momentum theory and the blade element momentum method A part of the book is dedicated to the description and implementation of vortex methods The remaining of the book focuses on the study of wind turbine aerodynamics using vortex theory analyses or vortex methods Examples of vortex theory applications are optimal rotor design tip loss corrections yaw models and dynamic inflow models Historical derivations and recent extensions of the models are presented The cylindrical vortex model is another example of a simple analytical vortex model presented in this book This model leads to the development of different BEM models and it is also used to provide the analytical velocity field upstream of a turbine or a wind farm under aligned or yawed conditions Different applications of numerical vortex methods are presented Numerical methods are used for instance to investigate the influence of a wind turbine on the incoming turbulence Sheared inflows and aero elastic simulations are investigated using vortex methods for the first time Many analytical flows are derived in details vortex rings vortex cylinders Hill's vortex vortex blobs etc They are used throughout the book to devise simple rotor models or to validate the implementation of numerical methods Several Matlab programs are provided to ease some of the most complex implementations

Mathematical Modelling of Energy Systems and Fluid Machinery Mirko Morini, Michele Pinelli, 2021-06-04 The ongoing digitalization of the energy sector which will make a large amount of data available should not be viewed as a passive ICT application for energy technology or a threat to thermodynamics and fluid dynamics in the light of the competition triggered by data mining and machine learning techniques These new technologies must be posed on solid bases for the representation of energy systems and fluid machinery Therefore mathematical modelling is still relevant and its importance cannot be underestimated The aim of this
