Thermal Decomposition Of Cyanate Ester Resins:

Chemistry and Technology of Cyanate Ester Resins I. Hamerton, 2012-12-06 After epoxy resins and polyimides cyanate esters arguably form the most well developed group of high temperature thermosetting polymers They possess a number of desirable performance characteristics which make them of increasing technological importance where their somewhat higher costs are acceptable The principal end uses for cyanate esters are as matrix resins for printed wiring board laminates and structural composites For the electronics markets the low dielectric loss characteristics dimensional stability at molten solder temperatures and excellent adhesion to conductor metals at temperatures up to 250 C are desirable In their use in aerospace composites unmodified cyanate esters offer twice the fracture toughness of multifunctional epoxies while achieving a service temperature intermediate between epoxy and bis maleimide capabilities Applications in radome construction and aircraft with reduced radar signatures utilize the unusually low capacitance properties of cyanate esters and associated low dissipation factors While a number of commercial cyanate ester monomers and prepoly mers are now available to date there has been no comprehensive review of the chemistry and recent technological applications of this versatile family of resins The aims of the present text are to present these in a compact readable form The work is primarily aimed at materials scientists and polymer technologists involved in research and development in the chemical electronics aerospace and adhesives industries It is hoped that advanced undergraduates and postgraduates in polymer chemistry and technology and materials science technology will find it a useful introduction and source of reference in the course of their studies

Thermal Decomposition of Cyanate Ester Resins ,2001 Polycyanurate networks were prepared by thermal polymerization of cyanate ester monomers containing two or more cyanate ester O C triple bond N functional groups The thermal decomposition chemistry of nine different polycyanurates was studied by thermogravimetry and infrared analysis of solid films and analysis of the gases evolved during pyrolysis using infrared spectroscopy and gas chromatography mass spectrometry It was found that the thermal stability of the polycyanurates was essentially independent of monomer chemical structure with the major mass loss occurring at about 450 deg C for all materials Analysis of the solid state and gas phase thermal degradation chemistry indicates a thermal decomposition mechanism for polycyanurates which begins with hydrocarbon chain scission and cross linking at temperatures between 400 deg 450 deg C with negligible mass loss followed by decyclization of the triazine ring at 450 deg C that liberates volatile cyanate ester decomposition products The solid residue after pyrolysis increases with the aromatic content of the polymer and incorporates about two thirds of the nitrogen and oxygen present in the original material

Handbook of Thermoset Plastics Andreas Kandelbauer, 2013-11-28 Due to their special structural features triazine ring oxygen linkages low dielectric loss cyanate ester resins represent a promising class of high performance polymers They are suitable as matrix materials for applications where among other properties stability at high service temperatures low dielectric loss and good mechanical performance is required This chapter deals

with some general aspects regarding the chemistry and technology of cyanate ester resins and highlights their most important applications Relevant performance characteristics of cyanate esters and selected blends with bismaleimide and epoxy resins are briefly discussed Some recent developments regarding novel monomers are presented as well *Synthetic Methods in Step-Growth Polymers* Martin E.
