The second section of the book deals with Research Considerations, with chapters ranging from how the study of disrupted communication can inform models of normal language processing through tone production and processing in speakers with aphasia to anomia and progressive multifocal leukoencephalopathy. Perspectives on Agrammatism Roelien Bastiaanse, Cynthia K. Thompson, 2012-05-04. Agrammatic aphasia, agrammatism resulting from brain damage to regions of the brain involved in language processing, affects grammatical aspects of language. Therefore, research examining language breakdown and recovery patterns in agrammatism is of great interest and importance to linguists, neurolinguists, neuropsychologists, neurologists, psycholinguists, and speech and language pathologists from all over the world. Research in agrammatism, studied across languages and from different perspectives, provides information about the grammatical structures that are affected by brain damage, their nature, and how language and the brain recover from brain damage. The chapters in this book focus on the symptoms that arise in agrammatic aphasia at the lexical, morphological, and sentence level, and address these

impairments from neurolinguistic neuropsychological and neurological perspectives Special attention is given to methods for assessment and treatment of agrammatism and to the neurobiological changes that can result from the treatments
