UNIX INTRODUCTION

The UNIX operating system is a multi-user computing environment designed to provide access to a range of computer applications, tools and utilities to the users of the system. It was designed and developed by Bell Laboratories in the late 60's and 70's for scientists at Bell Labs to help with research, such as writing and publishing technical papers, storing and manipulating data, communicating ideas and working with fellow colleagues.

Universities and colleges obtained UNIX from Bell Labs for research into operating system design. In particular, one university - UC Berkeley, made a variety of improvements and changes to UNIX and released its own version under the Berkeley Software Distribution (BSD) label. Bell Labs also improved its own version of UNIX under the System V name. Each variant provided similar functionality, but BSD

always remained a research oriented tool under the Berkeley umbrella until its last release (BSD 4.4) in the mid 90's. Companies who used UNIX as the primary operating system for their high-end servers and workstations licensed earlier releases of BSD and System V.

The Internet explosion has provided an immense collaborative environment, which has produced a widely popular UNIX clone for that it was not based on the original UNIX source code) called Linux. Linux provides the same functionality of BSD or SVSV UNIX, but is a completely new design from the ground up which runs on the Intel x86 platform, as well as other hardware architectures. Other variants of the original BSD UNIX include FreeBSD, OpenBSD and NetBSD.

- **UNIX Applications.** X Window System, Compilers, Mail, Word Processing.
- **UNIX Tools.** Bourne C Shell, Utilities (vi, nroff, man, ls, who, sort).
- **UNIX Kernel.** Device Drivers, Resource / Process / Memory Management.
- **Hardware.** CPU, Memory, Modem, Hard Drives, Network, Video, IO.

LOGGING IN/OUT

Logging In

Every UNIX user has a UNIX login username and password. This allows UNIX to keep track of the different people and provide a separate working space for each person within the same system. Users can obtain their UNIX username and password from their system administrator. UNIX is a case-sensitive environment, so take careful note of the upper and lowercase in the username and password.

Once the username and password is obtained, enter them at the login prompt:

```
Login: jsmith
Password: Florida
Welcome to SunOS 4.1.4 (GENERIC) Kernel
$
```

The "\$" is the UNIX Shell prompt. It may vary depending on the specific system (the most common variant is "\$"). The Shell is where the work will be completed for most of the session.

Changing the password

After logging in, change the password to something other than what was initially given. It is a good idea to

not use common words; instead, use a combination of numbers and letters. A good example is to use the first letters from a verse of a favorite poem, followed by two numbers. For example: *Twinkle, Twinkle, Little Star* becomes *mta42*.

It is possible to change the password with the **passwd** command:

```
$ passwd
Enter your old password: Florida
Enter your new password: mta42
Reenter your new password: mta42
Password changed.
$
```

Logging out

Since UNIX is a multi-user system, it is very important to log out of the session after the work is completed. This releases the terminal back to the login prompt so that the next user may login. Logging out can be accomplished by typing "exit" at the shell prompt:

```
$ exit
```

Depending on the shell, it is possible to use "logout" or "D" (Control-D).

THE UNIX FILESYSTEM

Once logged into the account, the most common tasks will be reading e-mail, editing, writing applications, writing and compiling programs, using databases, etc. All of these involve working with files. UNIX uses a hierarchical system to store and retrieve files using what are known as directories. The figure below shows an example of how typical UNIX systems directories are arranged.
