Visual Memory Advances In Visual Cognition:

Visual Memory Steven J. Luck, Andrew Hollingworth, 2008-09-10 Vision and memory are two of the most intensively studied topics in psychology and neuroscience This book provides a state of the art account of visual memory systems Each chapter is written by an internationally renowned researcher who has made seminal contributions to the topic

Visual Memory Timothy F. Brady, Wilma A. Bainbridge, 2022-03-29 Featuring contributions from world leading researchers this book explores the relationship between visual perception and memory It bridges the traditionally separate fields of vision science and recognition memory and deals with an interdisciplinary set of perspectives combining research in psychology neuroscience and artificial intelligence The book makes new connections between the wealth of research from each respective field developing the idea that visuospatial memory is our best memory system This volume traverses topics grounded in both empirical study and real world applications including working short term memory long term memory the neuroscience of memory development of memory over the lifespan autobiographical memories false memories and eyewitness testimony It argues that an increased knowledge of how visuospatial memory works can lead to an improved understanding of the basic features of memory as well as providing strategies for memory improvement The book features cutting edge visual memory research where converging methods in psychophysics cognitive neuroscience and computational modeling have been propelling the field forward Visual Memory is an essential read for all students and researchers of memory and visual perception It will also be useful for researchers and students in related fields including human computer interaction data visualization cognitive science and cognitive enhancement

Visual Memory Steven J. Luck, Andrew Hollingworth, 2008-09-10 Vision and memory are two of the most intensively studied topics in psychology and neuroscience The present book concerns the interaction between vision and memory How do we remember what we see And how does our memory for the visual world influence subsequent perception and action topics in psychology and neuroscience and the intersection between them visual memory is emerging as a fertile ground for research Certain memory systems appear to specialize in This book provides a state of the art account of visual memory systems Each chapter is written by an internationally renowned researcher who has made seminal contributions to the topic The chapters are comprehensive providing both a broad overview of each topic and a summary of the latest research They also present new perspectives that advance our theoretical understanding of visual memory and suggest directions for future research After an introductory overview by the editors chapters address visual sensory memory iconic memory visual short term memory and the relationship between visual memory and eye movements Visual long term memory is then reviewed from several different perspectives including memory for natural scenes the relationship between visual memory and object recognition and associative learning The final chapters discuss the neural mechanisms of visual memory and neuropsychological deficits in visual memory This book is a comprehensive guide to visual memory research that will be a valuable resource for both

Change Blindness and Visual Memory Daniel J. Simons, 2018-12-02 A central goal in the study of object and scene perception is to understand how visual information is integrated across views to provide a stable continuous experience of our environment Research on issues ranging from visual masking to priming across saccades to the representation of spatial layout across views has addressed the issue of what information is preserved from one view to the next Recently research on visual memory for objects and scenes has led to striking claims about the nature of the information that is and is not preserved from one instant to the next For example studies of change blindness have shown that striking changes to objects and scenes can go undetected when they coincide with an eye movement a flashed blank screen a blink or an occlusion event These studies suggest that relatively little visual information about objects and scenes is combined across views Despite these failures of change detection observers somehow manage to experience a stable continuous visual environment This special issue seeks to unite recent studies of change blindness with studies of visual integration to better understand the nature of our representations and the richness of our visual memory **Memory and Processing of Visual and Spatial Information** Hubert D. Instructing and Testing Advanced Learners Slava Kalyuga,2006 When we learn new and complex materials our cognitive processing capabilities are usually severely reduced due to limited working memory capacity Learner expertise in a specific domain decreases those limitations by enabling the use of the expert s organised knowledge base In many instructional situations however expertise may also trigger additional cognitive load because of the processing of redundant information Recently strong evidence has emerged that instructional techniques which are highly effective with novice learners can lose their effectiveness and even have negative consequences when used with advanced learners As learners become more knowledgeable in a domain instructional techniques and procedures often need to change radically in order to remain efficient To tailor instruction to levels of learner knowledge in computer based learning environments it is critical to have a simple and rapid measure of learner expertise suitable for real time testing research based recommendations on instructional techniques and diagnostic assessment methods that are suitable for advanced learners in multimedia learning environments
