Lamarckian theories of long-term morphological change are rejected and predatedarwinian ideas of species are changed over time.

This is a simulated activity for a virtual lab session on evolution. The activity is designed to help you understand the concept of natural selection and how it can lead to the formation of new species. The activity is divided into three parts: 1. Introduction to the concept of natural selection. 2. A simulation of the peppered moth population. 3. A discussion of the results of the simulation.

Introduction

Charles Darwin revolutionized our understanding of the history of evolution by natural selection. One of his difficulties in understanding the theory, however, was the lack of evidence of evolutionary change in short periods of time, which could be observed in the laboratory. Although Darwin was convinced of the importance of evolution, he felt that he had to wait for the discovery of the fossil record to provide the evidence of the gradual change in the history of life.

The scientific theory of evolution is based on the principle of natural selection. The theory states that the most fit individuals in a population will survive and reproduce, while the less fit individuals will die. This process is called natural selection.
