

ENTROPY, DISORDER

Entropy is the degree of randomness in a substance. This implies that change in entropy in ΔS , implies how more ordered and how less ordered. Molecules with smaller number have more ordered because they move about more freely, and gases have an even larger amount of entropy. According to the second law of thermodynamics, nature always proceeds in a state of highest entropy.

Entropy increases when the following reactions occur and decrease in enthalpy in following conditions ΔH or ΔG is negative.

HEAT OF REACTION, ENTHALPY

The equation for heat of reaction is $\Delta H = \Delta H^\circ - T\Delta S$

Here ΔH° is the standard enthalpy for ΔH and T is the temperature, ΔS represents the heat of reaction, ΔH is the change in enthalpy. T is temperature in Kelvin.

A negative value for ΔH means that the reaction is exothermic. That means that heat is released.

A positive value for ΔH means that the reaction is endothermic. That means that heat is absorbed.

A negative value for ΔS means that the products are more ordered than the reactants.

A positive value for ΔS means that the products are less ordered than the reactants.
