

The Digestive System

What is the digestive system?

The digestive system, or **gastrointestinal tract**, is a tract of organs that is responsible for digesting and absorbing nutrients from food. Food enters through the mouth, is broken down in the stomach, and then moves through the small intestine, where nutrients are absorbed. The digestive system also includes accessory organs that help in the process, such as the liver, pancreas, and gallbladder.

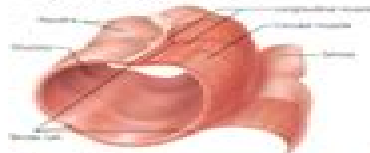

Liver, pancreas & gallbladder

Just below the stomach, organs known as the **liver**, **pancreas**, and **gallbladder** are located. The liver is the largest organ in the body, and it is responsible for producing **bile**, a substance that helps in the digestion of fats. The pancreas is a small, elongated organ that produces **pancreatic juice**, which contains enzymes that help in the digestion of carbohydrates, proteins, and fats. The gallbladder is a small, pear-shaped organ that stores bile.

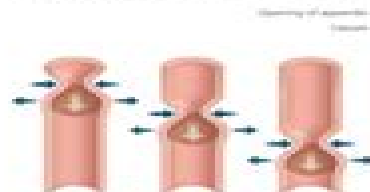

Layers of large intestine

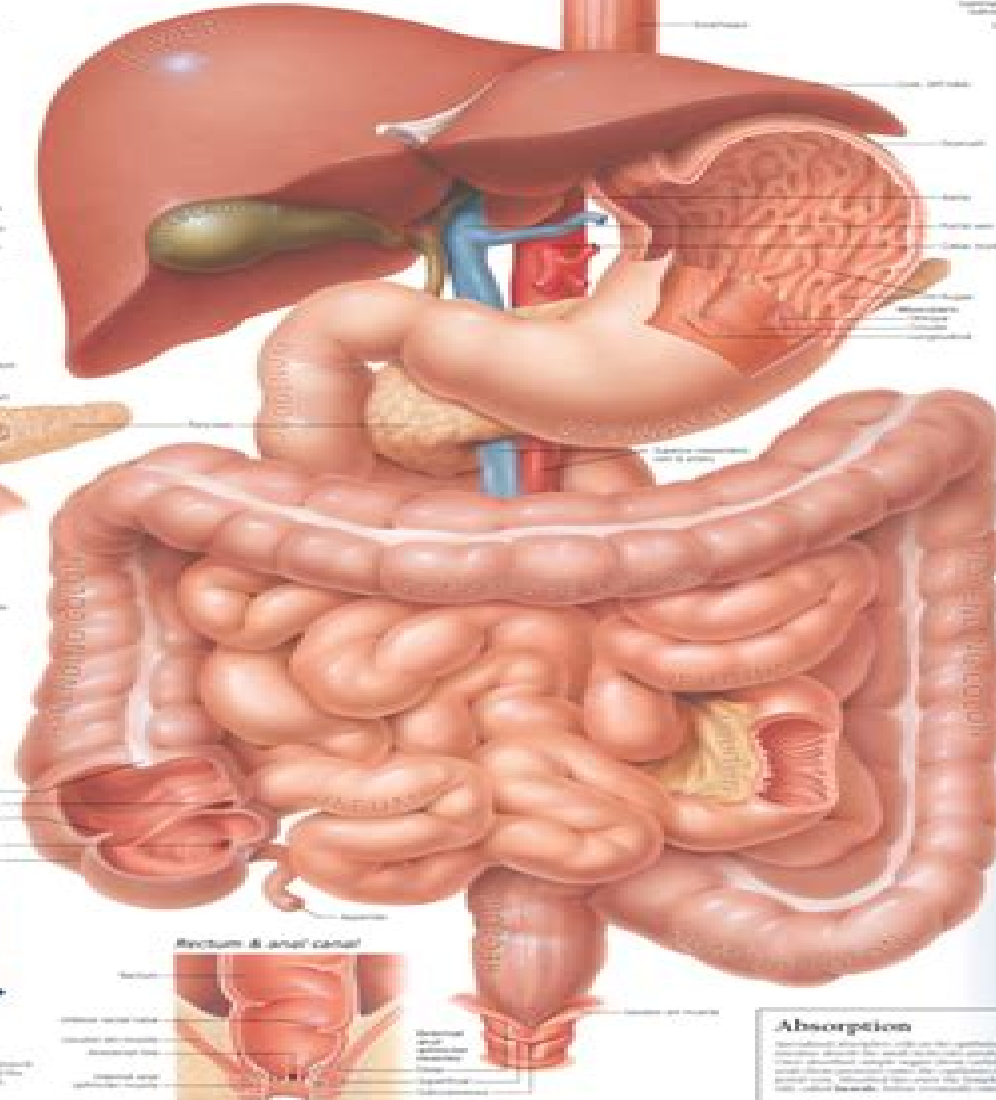

Large intestine

The large intestine, or **colon**, is the final part of the digestive system. It is responsible for absorbing water and electrolytes from the remaining indigestible food matter. The large intestine is divided into several parts, including the cecum, ascending colon, transverse colon, descending colon, and sigmoid colon.

Peristaltic action

Food material is pushed through the digestive system by a series of powerful, rhythmic contractions called **peristalsis**. These contractions are initiated by the **swallowing reflex** and the **defecation reflex**, which are controlled by the brain.

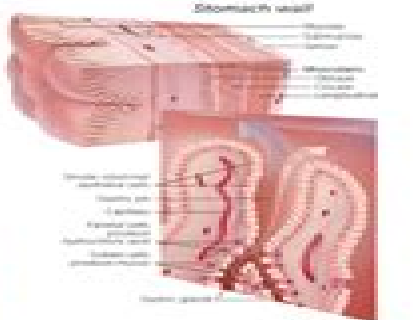

The mouth & salivary glands

Chewing, the mechanical action of the food, is called **mastication**. It begins in the mouth, where food is broken down into small pieces by the teeth. Saliva, a watery substance produced by the salivary glands, moistens the food and helps in the digestion of carbohydrates. The salivary glands are located in the mouth and produce saliva, which is then swallowed and enters the stomach.

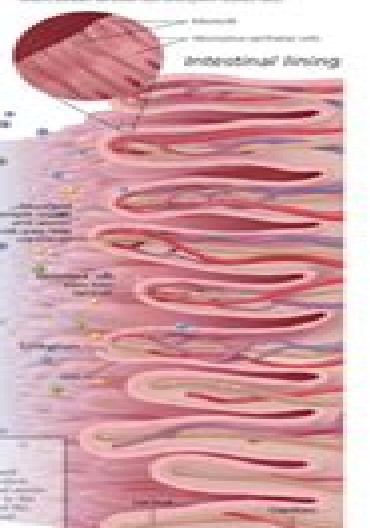

The stomach

The stomach is a large, muscular organ that is responsible for the **digestion** of food. It is located in the upper abdomen, just below the diaphragm. The stomach has a thick, muscular wall that contracts and relaxes to mix food with gastric juices, which are secreted by the stomach lining. The stomach also has a valve called the **pylorus**, which controls the passage of food into the small intestine.

Small intestine

The small intestine is a long, coiled tube that is responsible for the **digestion** of food. It is located in the lower abdomen, just below the stomach. The small intestine has a highly folded inner lining called **microvilli**, which increases the surface area for the absorption of nutrients. The small intestine is divided into three parts: the duodenum, jejunum, and ileum.

Absorption

The process of **absorption** is the final step in the digestive process. It involves the movement of nutrients from the small intestine into the bloodstream. The nutrients are absorbed through the **intestinal lining**, which is composed of a single layer of cells. The absorbed nutrients are then transported to the liver, where they are stored or used for energy.
