Concurrent Design of Products, Manufacturing Processes and Systems Ben Wang, 1999-01-27 Methods presented involve the use of simulation and modeling tools and virtual workstations in conjunction with a design environment This allows a diverse group of researchers manufacturers and suppliers to work within a comprehensive network of shared knowledge The design environment consists of engineering

workstations and servers and a suite of simulation quantitative computational analytical qualitative and experimental tools Such a design environment will allow the effective and efficient integration of complete product design manufacturing process design and customer satisfaction predictions This volume enables the reader to create an integrated concurrent engineering design and analysis infrastructure through the use of virtual workstations and servers provide remote instant sharing of engineering data and resources for the development of a product system mechanism part business and or process and develop applications fully compatible with international CAD CAM CAE standards for product representation and modeling

Efficiency of Manufacturing Processes Wen Li, 2015-06-13 This monograph presents a reliable methodology for characterising the energy and eco efficiency of unit manufacturing processes The Specific Energy Consumption SEC will be identified as the key indicator for the energy efficiency of unit processes An empirical approach will be validated on different machine tools and manufacturing processes to depict the relationship between process parameters and energy consumptions Statistical results and additional validation runs will corroborate the high level of accuracy in predicting the energy consumption In relation to the eco efficiency the value and the associated environmental impacts of manufacturing processes will also be discussed The interrelationship between process parameters process value and the associated environmental impact will be integrated in the evaluation of eco efficiency The book concludes with a further investigation of the results in order to develop strategies for further efficiency improvement The target audience primarily comprises researchers and experts in the field but the book may also be beneficial for graduate students

The Unit Manufacturing Process (UMP) Builder David Lechevalier, 2019 The ASTM E3012 Standard Guide for Characterizing Environmental Aspects of Manufacturing Processes provides guidelines for formally characterizing manufacturing processes However the difficulty that has arisen in the early use of the standard illustrates the need for intuitive tools for helping modeling experts to conform to the specified information model The Unit Manufacturing Process UMP Builder was developed at the National Institute of Standards and Technology NIST to provide a visual interface for helping modeling experts to conform to the specified ASTM information model The UMP Builder a browser based tool integrates symbolic mathematical and guided textual inputs helping to consistently record manufacturing process models for environmental sustainability into a repository The Builder also serves as a curator by providing capabilities to explore and visualize models recorded in the Builder repository The UMP Builder is adapted from of an open source tool called the Configurable Data Curation System CDCS

developed at NIST The CDCS was originally developed to capture share and transform materials data allowing users to upload an XML schema and create instances of that schema In the UMP Builder the schema used for creating the models is frozen The schema follows the guidelines from the ASTM E3012 standard The Builder also provides unique features that are specific in order to facilitate the modelling of UMPs This user's guide aims to provide guidelines to use the UMP Builder To obtain more information especially on the architecture please refer to the CDCS documentation

A Unit Manufacturing Process Characterization Methodology and Supporting Terminology for Sustainable Manufacturing Assessment

Ian C. Garretson, 2015 Manufacturing industry drives economic activity and growth around the world but manufacturing activities consume large amounts of material energy and labor resources Therefore the impacts of manufacturing need to be accounted for and reduced Direct benefits of manufacturing are products and income which in turn influence the lives of people in the local community and the consumers purchasing the manufactured products The design process for products and requisite manufacturing facilities should incorporate environmental and social criteria in addition to economic criteria to more comprehensively assess sustainability performance Sustainability assessments for manufactured products and manufacturing facilities can be carried out by assessing the incremental elements of manufacturing industry which are unit manufacturing processes UMPs A challenge in the research area is that current methods for UMP assessment are ad hoc and the methods do not incorporate the system as a whole The purpose of this research is to enable sustainable manufacturing decision making by 1 unifying an assessment methodology for UMPs 2 developing an information modeling framework for characterizing UMPs and workpieces and 3 demonstrating UMP composability connectivity modeling for use in sustainability assessments The methodology is developed through literature review and unifies 23 different UMP manufacturing assessment methods by analyzing each for overlapping and unique steps in the approaches Thus a nine step assessment methodology emerged which has multiple applications in industry including process and facility assessment and improvement A next step for MPF modeling is to link UMP models by modeling the workpiece state but supporting tools were needed to identify how to correctly model the interactions between the UMP and the workpiece The information modeling framework developed herein provides the theoretical background for how UMP models interact by linking the function of the UMP to the effect on the workpiece and by identifying the calculation variables necessary to assess UMPs The information modeling framework developed for composing UMP models is demonstrated through the energy analysis of a metal component The component is manufactured by recrystallization annealing reducing milling through hardening and recovery annealing tempering Models are composed connected by utilizing knowledge of how UMPs impart transformation to the workpiece and the information embedded in the workpiece that is transported to subsequent UMPs Workpiece information includes the geometry and properties of the current state and future states Previous work reported in literature has focused on geometry modeling e.g. CAD/CAM while this work focuses on property modeling This research develops an overarching

detailed approach to manufacturing sustainability assessments through in depth analysis of UMPs The result of using this UMP approach will provide guidance toward a more sustainable future Managerial Accounting ...
