Thresholds Of Climate Change In Ecosystems Sap 4:

Thresholds of Climate Change in Ecosystems William J. Brennan, 2010 This report addresses and synthesizes the current state of scientific understanding regarding potential abrupt state changes or regime shifts in ecosystems in response to climate change It provides an overview of what is known about ecological thresholds and where they are likely to occur The report also identifies those areas where research is most needed to improve knowledge and understand the uncertainties regarding them It suggests a suite of potential actions that land and resource managers could use to improve the likelihood of success for the resources they manage even under conditions of incomplete understanding of what drives thresholds of change and when changes will occur Charts and tables

Thresholds of Climate Change in Ecosystems (SAP 4. 2) U.s. Climate Change Science Program, 2015-02-06 As defined in this Synthesis and Assessment Report an ecological threshold is the point at which there is an abrupt change in an ecosystem quality property or phenomenon or where small changes in one or more external conditions produce large and persistent responses in an ecosystem Ecological thresholds occur when external factors positive feedbacks or nonlinear instabilities in a system cause changes to propagate in a domino like fashion that are potentially irreversible This report reviews threshold changes in North American ecosystems that are potentially induced by climatic change and addresses the significant challenges these threshold crossings impose on resource and land managers Sudden changes to ecosystems and the goods and services they provide are not well understood but they are extremely important if natural resource managers are to succeed in developing adaptation strategies in a changing world The report provides an overview of what is known about ecological thresholds and where they are likely to occur It also identifies those areas where research is most needed to improve knowledge and understand the uncertainties regarding them The report suggests a suite of potential actions that land and resource managers could use to improve the likelihood of success for the resources they manage even under conditions of incomplete understanding of what drives thresholds of change and when changes will occur Key examples of climate induced threshold changes are presented This synthesis effort identified a suite of potential actions that taken together or separately can begin to improve the understanding of thresholds and increase the likelihood of success in developing management and adaptation strategies in a changing climate before during and after thresholds are crossed In general it is essential to increase the resilience of ecosystems and thus to slow or prevent the crossing of thresholds to identify early warning signals of impending threshold changes and to employ adaptive management strategies to deal with new conditions new successional trajectories and new combinations of species
