IT security is paramount in today's digital age. As businesses increasingly rely on technology to operate, protecting sensitive data and preventing cyberattacks is a priority. Cloud adoption introduces more security risks, which include data breaches and loss of access. A strong IT security infrastructure safeguards customer information, financial data, intellectual property, and overall business operations. By investing in robust security measures, organizations can mitigate risks, maintain trust with customers, and help ensure business continuity. A multi-layered security architecture is essential for protection. Key areas to focus on include the following items:

- Hardware level security: Prevent physical tampering and help ensure data integrity.
- Virtualization security: Isolate environments and control resource access.
- Management tool security: Secure hardware and cloud resources.
- Operating system security: Continuously update for robust security.
- Storage security: Protect data at rest and in transit.
- Networking security: Prevent unauthorized access and data breaches.

This IBM Redbooks publication describes how the IBM Power ecosystem provides advanced security capabilities at each of these layers. IBM Power servers are designed with security as a core consideration. At the hardware level, advanced technology includes tamper-resistant features that are built in to the processor to prevent unauthorized access and modifications, secure cryptographic engines to provide strong encryption of data, and Trusted Boot to help ensure that only authorized software components are loaded during system startup. At the virtualization level, the hypervisor, which manages virtual machines (VMs), is designed to be secure and resistant to attacks. The hypervisor isolates workloads within a single physical server, which enables secure resource sharing within your infrastructure. The Hardware Management Console (HMC) provides centralized management and control of Power servers in a secure manner. The operating systems that run on IBM Power servers—IBM AIX, IBM i, and Linux on Power—offer robust security features, which include user authentication, access controls, and encryption support. Also, tools such as IBM PowerSC provide a comprehensive security and compliance solution that helps manage security policies, monitor threats, and enforce compliance. Security also requires solid management and control. This book describes best practices, such as conducting regular security audits, keeping operating systems and applications up to date with the latest security fixes, and implementing strong user authentication and authorization policies. Other critical elements include the implementation of data encryption for both data at rest and in transit, and strong network security processes that use firewalls, intrusion detection systems (IDS), and other security measures. By combining these hardware, software, and management practices, IBM Power provides a robust foundation for security in your IT environment.

Dissertation from the year 2014 in the subject Computer Science Commercial Information Technology grade 4 5 Egerton University language English abstract Cloud computing has 3 primary service models including SaaS IaaS and PaaS which are classified depending on the level for which a service user interacts with the service provider s systems in accessing memory processing power and storage Deployment models of cloud computing include hybrid community public and private clouds depending on the approach to hosting and the number of clients sharing a resource Due to the prohibitive nature of private cloud computing and requirement for specialized systems in community clouds the most suitable approach to cloud computing for small and medium enterprises is public cloud computing In this regard this study was aimed at determining the extent to which implementation of public cloud computing by enterprise companies is feasible Due to the cultural and the absence of law in Saudi Arabia ensuring the protection of data in the cloud challenges in implementing cloud computing in the country are related to adherence to the data governance structure For instance privacy and security are important for enterprise companies since the local culture values the safeguarding of family and individual information In addition information transferred through the cloud system must adhere to the conservative philosophy and data privacy which limits the level of compatibility in cloud computing between Saudi Arabia and the western world Since most service providers are

based in the west companies have to identify a service provider that tailors its products to suit the market in Saudi Arabia Therefore implementation of public cloud computing in Saudi Arabia is feasible as long as companies select a service provider with a positive reputation limit posting of sensitive information to the cloud server and implement cloud computing gradually to avert the possibility of complete failure This study determined that SaaS cloud computing is feasible for enterprise companies in Saudi Arabia but further study is required to examine the feasibility of IaaS and PaaS In addition a larger study should be done to collect quantitative data to determine the implications of cloud computing in a representative sample
