Triangulated Categories Triangulated Categories:

Triangulated Categories Thorsten Holm, Peter Jørgensen, Raphaël Rouquier, 2010-06-24 Over the last few decades triangulated categories have become increasingly important to the extent that they can now be viewed as a unifying theory underlying major parts of modern mathematics This 2010 collection of survey articles written by leading experts covers fundamental aspects of triangulated categories as well as applications in algebraic geometry representation theory commutative algebra microlocal analysis and algebraic topology These self contained articles are a useful introduction for graduate students entering the field and a valuable reference for experts

Triangulated Categories Amnon Neeman, 2014-09-08 The first two chapters of this book offer a modern self contained exposition of the elementary theory of triangulated categories and their quotients The simple elegant presentation of these known results makes these chapters eminently suitable as a text for graduate students The remainder of the book is devoted to new research providing among other material some remarkable improvements on Brown's classical representability theorem In addition the author introduces a class of triangulated categories the well generated triangulated categories and studies their properties This exercise is particularly worthwhile in that many examples of triangulated categories are well generated and the book proves several powerful theorems for this broad class These chapters will interest researchers in the fields of algebra algebraic geometry homotopy theory and mathematical physics

Triangulated Categories in Representation Theory and Beyond Petter Andreas Bergh, Steffen Oppermann, Øyvind Solberg, 2024-07-29 In recent years triangulated categories have proved very successful as a common mathematical framework for formulating important advances in various fields and at the same time for the interaction between different subject areas The purpose of the symposium was therefore not only the study of triangulated categories in itself but rather fruitful exchanges between disciplines The symposium brought together established researchers who have made important contributions involving triangulated categories Many participants came from representation theory but there were also participants with backgrounds in commutative algebra geometry and algebraic topology

Triangulated Categories in the Representation Theory of Finite Dimensional Algebras Dieter Happel, 1988 An introduction to the use of triangulated categories in the study of representations of finite dimensional algebras

Triangulated Categories and Applications Ivo Dell'Ambrogio, 2016 Examples of triangulated categories abound throughout mathematics the stable homotopy category in topology derived categories or motivic categories in algebra and geometry Kasparov categories of C^* algebras etc When working at the level of triangulated categories deep features and surprising similarities of these disparate subjects are brought to light Triangulated categories provide an axiomatic framework for among other things performing homological computations for classifying objects up to homological operations and for formulating duality results The results become particularly powerful when a symmetric tensor structure is also available My research has mostly contributed to the development of these three aspects of the theory and applied it to

the algebraic and geometric examples as well as to the equivariant Kasparov theory of groups

Triangulated Categories in the Representation of Finite Dimensional Algebras Dieter Happel, 1988-02-11 Happel presents an introduction to the use of triangulated categories in the study of representations of finite dimensional algebras. In recent years representation theory has been an area of intense research and the author shows that derived categories of finite dimensional algebras are a useful tool in studying tilting processes. Results on the structure of derived categories of hereditary algebras are used to investigate Dynkin algebras and iterated tilted algebras. The author shows how triangulated categories arise naturally in the study of Frobenius categories. The study of trivial extension algebras and repetitive algebras is then developed using the triangulated structure on the stable category of the algebra's module category. With a comprehensive reference section, algebraists and research students in this field will find this an indispensable account of the theory of finite dimensional algebras.

Methods of Homological Algebra Sergei I. Gelfand, Yuri I. Manin, 2013-03-09 Homological algebra first arose as a language for describing topological prospects of geometrical objects. As with every successful language it quickly expanded its coverage and semantics and its contemporary applications are many and diverse. This modern approach to homological algebra by two leading writers in the field is based on the systematic use of the language and ideas of derived categories and derived functors. Relations with standard cohomology theory, sheaf cohomology, spectral sequences etc are described. In most cases complete proofs are given. Basic concepts and results of homotopical algebra are also presented. The book addresses people who want to learn a modern approach to homological algebra and to use it in their work. For the second edition the authors have made numerous corrections.

Lecture Notes on Motivic Cohomology Carlo Mazza, Vladimir Voevodsky, Charles A. Weibel, 2006 The notion of a motive is an elusive one like its namesake the motif of Cezanne's impressionist method of painting. Its existence was first suggested by Grothendieck in 1964 as the underlying structure behind the myriad cohomology theories in Algebraic Geometry. We now know that there is a triangulated theory of motives discovered by Vladimir Voevodsky which suffices for the development of a satisfactory Motivic Cohomology theory. However the existence of motives themselves remains conjectural. This book provides an account of the triangulated theory of motives. Its purpose is to introduce Motivic Cohomology to develop its main properties and finally to relate it to other known invariants of algebraic varieties and rings such as Milnor K theory, étale cohomology and Chow groups. The book is divided into lectures grouped in six parts. The first part presents the definition of Motivic Cohomology based upon the notion of presheaves with transfers. Some elementary comparison theorems are given in this part. The theory of étale Nisnevich and Zariski sheaves with transfers is developed in parts two, three and six respectively. The theoretical core of the book is the fourth part presenting the triangulated category of motives. Finally the comparison with higher Chow groups is developed in part five. The lecture notes format is designed for the book to be read by an advanced graduate student or an expert in a related field. The lectures roughly correspond to one hour lectures given by Voevodsky during the course he gave at the

Institute for Advanced Study in Princeton on this subject in 1999 2000 In addition many of the original proofs have been simplified and improved so that this book will also be a useful tool for research mathematicians Information for our distributors Titles in this series are copublished with the Clay Mathematics Institute Cambridge MA Homological Theory of Representations Henning Krause, 2021-11-18 Modern developments in representation theory rely heavily on homological methods This book for advanced graduate students and researchers introduces these methods from their foundations up and discusses several landmark results that illustrate their power and beauty Categorical foundations include abelian and derived categories with an emphasis on localisation spectra and purity The representation theoretic focus is on module categories of Artin algebras with discussions of the representation theory of finite groups and finite quivers Also covered are Gorenstein and quasi hereditary algebras including Schur algebras which model polynomial representations of general linear groups and the Morita theory of derived categories via tilting objects The final part is devoted to a systematic introduction to the theory of purity for locally finitely presented categories covering pure injectives definable subcategories and Ziegler spectra With its clear detailed exposition of important topics in modern representation theory many of which were unavailable in one volume until now it deserves a place in every representation theorist's library **Trends in Representation Theory of Algebras and Related Topics** Andrzej Skowroński, 2008 This book is concerned with recent trends in the representation theory of algebras and its exciting interaction with geometry topology commutative algebra Lie algebras quantum groups homological algebra invariant theory combinatorics model theory and theoretical physics The collection of articles written by leading researchers in the field is conceived as a sort of handbook providing easy access to the present state of knowledge and stimulating further development The topics under discussion include diagram algebras Brauer algebras cellular algebras quasi hereditary algebras Hall algebras Hecke algebras symplectic reflection algebras Cherednik algebras Kashiwara crystals Fock spaces preprojective algebras cluster algebras rank varieties varieties of algebras and modules moduli of representations of quivers semi invariants of quivers Cohen Macaulay modules singularities coherent sheaves derived categories spectral representation theory Coxeter polynomials Auslander Reiten theory Calabi Yau triangulated categories Poincaré duality spaces selfinjective algebras periodic algebras stable module categories Hochschild cohomologies deformations of algebras Galois coverings of algebras tilting theory algebras of small homological dimensions representation types of algebras and model theory This book consists of fifteen self contained expository survey articles and is addressed to researchers and graduate students in algebra as well as a broader mathematical community They contain a large number of open problems and give new perspectives for research in the field Purity, Spectra and Localisation Mike Prest, 2009-06-04 A unified coherent account of the algebraic aspects and uses of the Ziegler spectrum It may be used as an introductory graduate level text providing relevant background material and a wealth of illustrated examples An extensive index and thorough referencing also make this book an ideal reference **Riemannian Holonomy Groups and**
