in Quantum Theory Michael Demuth, M. Krishna, 2006-09-12

The main objective of this book is to give a collection of criteria available in the spectral theory of selfadjoint operators and to identify the spectrum and its components in the Lebesgue decomposition Many of these criteria were published in several articles in different journals We collected them added some and gave some overview that can serve as a platform for further research activities Spectral theory of Schrödinger type operators has a long history however the most widely used methods were limited in number For any selfadjoint operator A on a separable Hilbert space the spectrum is identified by looking at the total spectral measure associated with it often studying such a measure meant looking at some transform of the measure The transforms were of the form $f(A)f$ which is expressible by the spectral theorem as $\int f(x) d\mu_x$ for some finite measure The two most widely used functions were the sine exponential function $\sin x$ and the inverse function $\arcsin x$ These functions are usable in the sense that they can be manipulated with respect to addition of operators which is what one considers most often in the spectral theory of Schrödinger type operators Starting with this basic structure we look at the transforms of measures from which we can recover the measures and their components in Chapter 1 In Chapter 2 we repeat the standard spectral theory of selfadjoint operators The spectral theorem is given also in the Hahn Hellinger form Both Chapter 1 and Chapter 2 also serve to introduce a series of definitions and notations as they prepare the background which is necessary for the criteria in Chapter 3

Marchetti, Walter F. Wreszinski, 2013 Time decays form the basis of a multitude of important and interesting phenomena in quantum physics that range from spectral properties resonances return and approach to equilibrium to quantum mixing dynamical stability properties and irreversibility and the arrow of time This monograph is devoted to a clear and precise yet pedagogical account of the associated concepts and methods Mathematical Scattering Theory Dmitri_ Rael_ evich I_Afaev, 2010-03-10 The main subject of this book is applications of methods of scattering theory to differential operators primarily the Schrodinger operator There are two different trends in scattering theory for differential operators The first one relies on the abstract scattering theory The second one is almost independent of it In this approach the abstract theory is replaced by a concrete investigation of the corresponding differential equation In this book both of these trends are presented The first half of this book begins with the summary of the main results of the general scattering theory of the

previous book by the author *Mathematical Scattering Theory General Theory* American Mathematical Society 1992 The next three chapters illustrate basic theorems of abstract scattering theory presenting in particular their applications to scattering theory of perturbations of differential operators with constant coefficients and to the analysis of the trace class method In the second half of the book direct methods of scattering theory for differential operators are presented After considering the one dimensional case the author returns to the multi dimensional problem and discusses various analytical methods and tools appropriate for the analysis of differential operators including among others high and low energy asymptotics of the Green function the scattering matrix ray and eikonal expansions The book is based on graduate courses taught by the author at Saint Petersburg Russia and Rennes France Universities and is oriented towards a reader interested in studying deep aspects of scattering theory for example a graduate student in mathematical physics

Operator Semigroups Meet Complex Analysis, Harmonic Analysis and Mathematical Physics Wolfgang Arendt, Ralph Chill, Yuri Tomilov, 2015-12-10 This proceedings volume originates from a conference held in Herrnhut in June 2013 It provides unique insights into the power of abstract methods and techniques in dealing successfully with numerous applications stemming from classical analysis and mathematical physics The book features diverse topics in the area of operator semigroups including partial differential equations martingale and Hilbert transforms Banach and von Neumann algebras Schrödinger operators maximal regularity and Fourier multipliers interpolation operator theoretical problems concerning generation perturbation and dilation for example and various qualitative and quantitative Tauberian theorems with a focus on transfinite induction and magics of Cantor The last fifteen years have seen the dawn of a new era for semigroup theory with the emphasis on applications of abstract results often unexpected and far removed from traditional ones The aim of the conference was to bring together prominent experts in the field of modern semigroup theory harmonic analysis complex analysis and mathematical physics and to present the lively interactions between all of those areas and beyond In addition the meeting honored the sixtieth anniversary of Prof C J K Batty whose scientific achievements are an impressive illustration of the conference goal These proceedings present contributions by prominent scientists at this international conference which became a landmark event They will be a valuable and inspiring source of information for graduate students and established researchers
