Classical vehicle dynamics which is the basis for manned ground vehicle design has exhausted its potential for providing novel design concepts to a large degree At the same time unmanned ground vehicle UGV dynamics is still in its infancy and is currently being developed using general analytical dynamics principles with very little input from actual vehicle dynamics theory This technical book presents outcomes from the NATO Advanced Study Institute ASI Advanced Autonomous Vehicle Design for Severe Environments held in Coventry UK in July 2014 The ASI provided a platform for world class professionals to meet and discuss leading edge research engineering accomplishments and future trends in manned and unmanned ground vehicle dynamics terrain mobility and energy efficiency The outcomes of this collective effort serve as an analytical foundation for autonomous vehicle design Topics covered include historical aspects pivotal accomplishments and the analysis of future trends in on and off road manned and unmanned vehicle dynamics terramechanics soil dynamic characteristics uncertainties and stochastic characteristics of vehicle environment interaction for agile vehicle dynamics modeling new methods and techniques in on line control and learning for vehicle autonomy fundamentals of agility and severe environments mechatronics and cyber physics issues of agile vehicle dynamics to design for control energy harvesting and cyber security and case studies of agile and inverse vehicle dynamics and vehicle systems design including optimisation of suspension and driveline systems The book targets graduate students who desire to advance further in leading edge vehicle dynamics topics in manned and unmanned ground vehicles PhD students continuing their research work and building advanced curricula in academia and industry and researchers in government agencies and private companies

Real-Time Road Profile Identification and Monitoring Yechen Qin, Hong Wang, Yanjun Huang, Xiaolin Tang, 2019-01-22

Ever stringent vehicle safety legislation and consumer expectations inspire the improvement of vehicle dynamic performance which result in a rising number of control strategies for vehicle dynamics that rely on driving conditions Road profiles as the primary excitation source of vehicle systems play a critical role in vehicle dynamics and also in public transportation Knowledge of precise road conditions can thus be of great assistance for vehicle companies and government departments to develop proper dynamic control algorithms and to fix roads in a timely manner and at the minimum cost respectively As a result developing easy to use and accurate road estimation methods are of great importance

in terms of reducing the cost related to vehicles and road maintenance as well as improving passenger comfort and handling capacity A few books have already been published on road profile modeling and the influence of road unevenness on vehicle response However there is still room to discuss road assessment methods based on vehicle response and how road conditions can be used to improve vehicle dynamics In this book we use several generalized vehicle models to demonstrate the concepts methods and applications of vehicle response based road estimation algorithms In addition necessary tools algorithms and methods are illustrated and the benefits of the road estimation algorithms are evaluated Furthermore several case studies of controllable suspension systems to improve vehicle vertical dynamics are presented **Road and Off-Road Vehicle**
