

Anatomy of a Landfill

Landfill Gas Conversion

Decomposing waste in landfills naturally produces methane gas. The gas is collected through pipes that lead to a facility for conversion to renewable energy or to be flared.

Desilting Basin

Desilting basins help protect our streams and ocean. They capture storm water runoff and trap sediment, keeping it from entering the storm water treatment plant.

Condensate and Leachate Storage Tanks

Leachate is liquid that results from decomposing waste. Condensate is the liquid that forms inside the landfill gas collection system. These liquids are collected and stored in tanks. Some of the collected liquids are used for dust control.

Creating a Cell

Each day trash is placed, compacted and covered with a layer of soil or tarp in sections until a specified time is reached, forming a cell.

Environmental Protection

1. To control dust, trucks continuously spray dirt areas with water that has been "recycled" at the landfill.
2. Portable systems are used to trap and collect any stray litter, to keep it from flying away. They can be moved based on wind direction.
3. Special mixing machines spray a very fine mist into the air to help confine odors.
