

The Nervous System

The nervous system

The nervous system is composed of two integrated subdivisions: an extensive peripheral nervous system, which extends throughout the body, and a central nervous system, which is located in the head and spine.

The CNS includes the brain and spinal cord, which are covered by protective meninges called the leptomeninges (pia mater, arachnoid mater, and dura mater). The brain is the central control center, and the spinal cord is the main communication pathway between the brain and the rest of the body. The PNS includes all the nerves and ganglia that are not part of the CNS. The PNS is responsible for carrying information from the CNS to the rest of the body and vice versa.

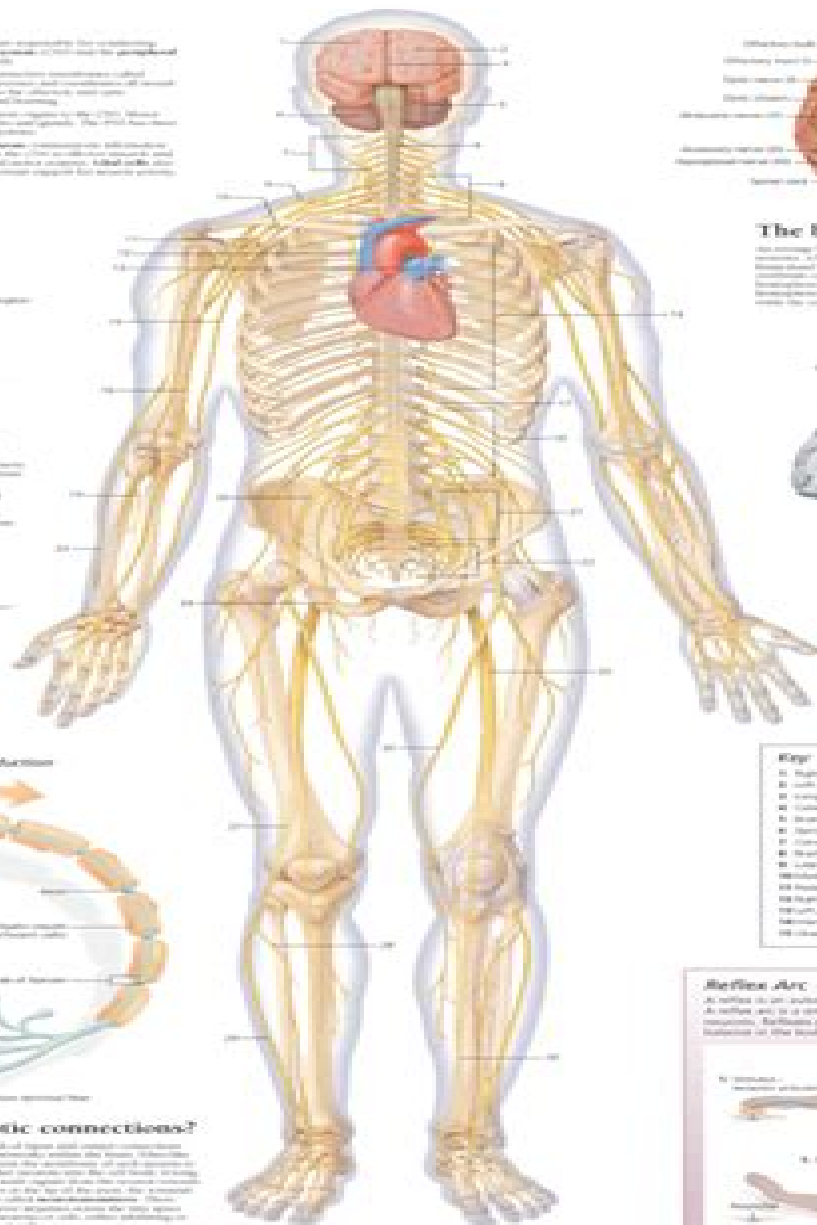

The leptomeninges consist of three layers: the pia mater, the arachnoid mater, and the dura mater. The pia mater is the innermost layer, and it is in direct contact with the brain. The arachnoid mater is the middle layer, and it is separated from the pia mater by the subarachnoid space. The dura mater is the outermost layer, and it is separated from the arachnoid mater by the subdural space.

Spinal cord

The spinal cord and nerves

The spinal cord is a long, thin, tube-shaped structure that extends from the base of the brain down to the lower back. It is composed of 31 pairs of spinal nerves, which are responsible for carrying information between the brain and the rest of the body. The spinal cord is surrounded by three layers of meninges: the pia mater, the arachnoid mater, and the dura mater. The spinal cord is also surrounded by cerebrospinal fluid, which provides it with nutrients and protection.

The brain

The brain is the central control center of the nervous system. It is composed of three main parts: the cerebrum, the cerebellum, and the brainstem. The cerebrum is the largest part of the brain and is responsible for higher-level functions such as thought, memory, and emotion. The cerebellum is located at the back of the brain and is responsible for coordination and balance. The brainstem is located at the base of the brain and is responsible for basic functions such as breathing and heart rate.

Structure of motor neurons

Motor neurons are responsible for carrying information from the brain to the muscles and glands. They are composed of a cell body (soma) and a long axon. The cell body contains the nucleus and other organelles. The axon is covered by a myelin sheath, which is formed by Schwann cells. The myelin sheath helps to insulate the axon and speed up the transmission of electrical impulses.

Synaptic knob or axon terminal of presynaptic neuron

What are synaptic connections?

Synaptic connections are the points where two neurons meet and communicate. They are formed by the axon terminal of one neuron and the dendrite of another neuron. The axon terminal contains synaptic vesicles that release neurotransmitters into the synaptic cleft. The neurotransmitters then bind to receptors on the dendrite of the other neuron, which triggers an electrical impulse that travels down the axon.
