Coherent Vibrational Dynamics Guglielmo Lanzani, Giulio Cerullo, Sandro De Silvestri, 2007-11-29

Remarkable developments in the spectroscopy field regarding ultrashort pulse generation have led to the possibility of producing light pulses ranging from 50 to 5 fs and frequency tunable from the near infrared to the ultraviolet range Such pulses enable us to follow the coupling of vibrational motion to the electronic transitions in molecules and

Molecular Relaxation in Liquids Biman Bagchi, 2012-01-30 This book brings together many different relaxation phenomena in liquids under a common umbrella and provides a unified view of apparently diverse phenomena It aligns recent experimental results obtained with modern techniques with recent theoretical developments Such close interaction between experiment and theory in this area goes back to the works of Einstein Smoluchowski Kramers and de Gennes Development of ultrafast laser spectroscopy recently allowed study of various relaxation processes directly in the time domain with time scales going down to picosecond ps and femtosecond fs time scales This was a remarkable advance because many of the fundamental chemical processes occur precisely in this range and was inaccessible before the 1980s Since then an enormous wealth of information has been generated by many groups around the world who have discovered many interesting phenomena that has fueled further growth in this field As emphasized throughout the book the seemingly different phenomena studied in this area are often closely related at a fundamental level Biman Bagchi explains why relatively small although fairly sophisticated theoretical tools have been successful in explaining a wealth of experimental data at a semi phenomenological level
