Multifunction Transceiver Architecture and Technology for Future Wireless Systems Jaber Moghaddasi, 2017 Since the very early wireless transmission of radiofrequency signals it has been gradually flourished and exploited in a wider and wider range of applications Among all those applications of radio technology sensing and communicating are undoubtedly the most indispensable ones There are a large number of practical scenarios such as intelligent transportations in which vehicles must be equipped with both radar and communication devices to be capable of both sensing the environment and communication with other onboard units The emerging 5G technology can be another important example in which multiple sensors and radios should be capable of cooperating with each other in an autonomous or semi autonomous manner The operation principles of these radar and radio devices are different Such fundamental differences can result in using different operational signal distinct signal processing and transceiver architectures in these systems that can raise challenges for integration of all required functions within a single platform Other than that there exist some applications where several functions of a single device i e sensor or radio are required to be executed simultaneously For example 2D angle of arrival detection systems require estimating the angle of arrival AOA of the incoming beam in both horizontal and vertical planes at the same time Multiband and multimode radio communication is another example of this kind where a radio system is desired to be capable of communication within several frequency bands and in several modes e g time or frequency division duplexing At a first glance one can feel that the mechanical assembling of several distinct devices is not the best solution regarding the cost simplicity and functionality or operability Hence the research attempt in developing a rather unified and compact transceiver architecture as opposed to a classical platform with assembled multiple individual devices comes out of horizon which is addressed specifically in this work Depending on the wireless functions that are to be integrated within a single multifunction system the solution should address multiple aspects simultaneously For instance any solution for integrating radar and radio related functions should be able to deal with two principal aspects namely operational waveform and RF front end architecture However in some other above mentioned examples such as 2D DOA detection system identical operational waveform may be used and the main challenge of functional integration would

pertain to a unification of multiple mono functional transceivers **Wireless Communications Systems Architecture**
