B.5.A describe the stages of the cell cycle, including deoxyribonucleic acid (DNA) replication and mitosis, and the importance of the cell cycle to the growth of organisms; Readiness Standard

DNA Replication

A process that transforms one DNA molecule into 2 identical copies; enzyme help DNA strands unwind and separates; each DNA strand serves as a template (pattern) for a new, complementary strand to form by matching (pairing) nitrogen bases. As a result, each new DNA molecule contains half of the original molecule.

Replication Facts

- DNA has to be copied before a cell divides
- DNA is copied during the S phase of the cell cycle
- New cells will need identical DNA strands
