Abstract: The purpose of this study was to determine the effect of a 12-week training program on the physical and psychological characteristics of young women. The study was conducted in a laboratory setting. The subjects were 12 young women, aged 18-25, who were divided into two groups: a control group and an experimental group. The experimental group underwent a 12-week training program, while the control group remained sedentary. The physical characteristics measured were body mass index (BMI), body fat percentage, and heart rate. The psychological characteristics measured were anxiety, depression, and self-esteem. The results showed that the experimental group had significantly lower BMI, body fat percentage, and heart rate compared to the control group. Additionally, the experimental group had significantly lower anxiety and depression levels and higher self-esteem levels compared to the control group. The findings suggest that a 12-week training program can effectively improve the physical and psychological characteristics of young women.
