Judgment and Decision Making Under Uncertainty: Descriptive, Normative, and Prescriptive Perspectives David R. Mandel, Gorka Navarrete, Nathan Dieckmann, Jonathan D. Nelson, 2019-09-26

Psychosocial Job Dimensions and Distress/Well-Being: Issues and Challenges in Occupational Health Psychology Renato Pisanti, Anthony J. Montgomery, James Campbell Quick, 2018-02-01 Over the last three decades a large body of research has showed that psychosocial job dimensions such as time pressure decision authority and social support could have significant implications for psychological distress and well being Theoretical models such as the job demand control social support model JDCA model the effort reward imbalance model ERI model the job demands resources model JDR model and the vitamin model suggest that distress and positive dimensions at work well being and motivation can be considered as two sides of the same coin If the job is designed to provide the right mix of psychosocial job dimensions e g optimal time pressure decision authority and social support work can boost job engagement and well being as well as productive behaviors at work When the job is not designed in an optimal way e g too much time pressure and too little decision authority work can trigger stress reactions and burnout Although some insight has been gained on how job dimensions could predict distress and well being and also into the dimensions that might moderate and mediate these associations research still faces several challenges Firstly most of this research has been cross sectional in nature thus making it difficult to conclude on the long term effects of psychosocial job dimensions Another challenge concerns how the contextual dimensions can be incorporated into micro levels models on employee stress and well being Nowadays work is carried out in the context of a wider environment that includes organizational variables So far the role of the organizational variables in the theoretical frameworks for explaining the relationships between psychosocial job dimensions employee distress and well being has often been underplayed The main aim of this research topic is to bring together international research from different theoretical and methodological perspectives in order to advance knowledge and practice in the field of work stress

The Growing-Block View Graeme Forbes, 2025-05-15 What makes time interesting and what is time

Graeme A Forbes presents a robust defence of the metaphysical asymmetry between past and future providing a compelling argument for the acceptance of the Growing Block view Taking us from the armchair to philosophy of physics and then out to the human world Forbes considers the ontological questions that have been the focus of most of the literature on the metaphysics of time Across three parts he addresses questions central to the philosophy of time Part I asks why we should think that time does something that space does not Part II examines why we should think that the past differs in some metaphysically interesting way from the future and Part III shows why we should accept the Growing Block view the view on which the past exists the future doesn't and the passage of time is causation bringing about events in accordance with the laws of nature This wide ranging and engaging exploration of persistence experience agency and more makes a radical contribution to our understanding of the philosophy of time

Casanova, Mikhail Lebedev, Ioan Opris , 2018-09-14 The final volume in this tripartite series on Brain Augmentation is entitled From Clinical Applications to Ethical Issues and Futuristic Ideas Many of the articles within this volume deal with translational efforts taking the results of experiments on laboratory animals and applying them to humans In many cases these interventions are intended to help people with disabilities in such a way so as to either restore or extend brain function Traditionally therapies in brain augmentation have included electrical and pharmacological techniques In contrast some of the techniques discussed in this volume add specificity by targeting select neural populations This approach opens the door to where and how to promote the best interventions Along the way results have empowered the medical profession by expanding their understanding of brain function Articles in this volume relate novel clinical solutions for a host of neurological and psychiatric conditions such as stroke Parkinson s disease Huntington s disease epilepsy dementia Alzheimer s disease autism spectrum disorders ASD traumatic brain injury and disorders of consciousness In disease symptoms and signs denote a departure from normal function Brain augmentation has now been used to target both the core symptoms that provide specificity in the diagnosis of a disease as well as other constitutional symptoms that may greatly handicap the individual The volume provides a report on the use of repetitive transcranial magnetic stimulation rTMS in ASD with reported improvements of core deficits i e executive functions TMS in this regard departs from the present day trend towards symptomatic treatment that leaves unaltered the root cause of the condition In diseases such as schizophrenia brain augmentation approaches hold promise to avoid lengthy pharmacological interventions that are usually riddled with side effects or those with limiting returns as in the case of Parkinson s disease Brain stimulation can also be used to treat auditory verbal hallucination visuospatial hemispatial neglect and pain in patients suffering from multiple sclerosis The brain acts as a telecommunication transceiver wherein different bandwidth of frequencies brainwave oscillations transmit information Their baseline levels correlate with certain behavioral states The proper integration of brain oscillations provides for the phenomenon of binding and central coherence Brain augmentation may foster the normalization of brain oscillations in nervous system disorders These techniques hold the promise of being applied remotely under the supervision of medical personnel thus overcoming the obstacle of travel in order to obtain healthcare At present traditional

thinking would argue the possibility of synergism among different modalities of brain augmentation as a way of increasing their overall effectiveness and improving therapeutic selectivity Thinking outside of the box would also provide for the implementation of brain to brain interfaces where techniques proper to artificial intelligence could allow us to surpass the limits of natural selection or enable communications between several individual brains sharing memories or even a global brain capable of self organization Not all brains are created equal Brain stimulation studies suggest large individual variability in response that may affect overall recovery treatment or modify desired effects of a given intervention The subject's age gender hormonal levels may affect an individual's cortical excitability In addition this volume discusses the role of social interactions in the operations of augmenting technologies Finally augmenting methods could be applied to modulate consciousness even though its neural mechanisms are poorly understood Finally this volume should be taken as a debate on social moral and ethical issues on neurotechnologies Brain enhancement may transform the individual into someone or something else These techniques bypass the usual routes of accommodation to environmental exigencies that exalted our personal fortitude learning exercising and diet This will allow humans to preselect desired characteristics and realize consequent rewards without having to overcome adversity through more laborious means The concern is that humans may be playing God and the possibility of an expanding gap in social equity where brain enhancements may be selectively available to the wealthier individuals These issues are discussed by a number of articles in this volume Also discussed are the relationship between the diminishment and enhancement following the application of brain augmenting technologies the problem of mind control with BMI technologies free will the duty to use cognitive enhancers in high responsibility professions determining the population of people in need of brain enhancement informed public policy cognitive biases and the hype caused by the development of brain augmenting approaches
