Topics In Photosynthesis Volume 5 Chloroplast Biogenesis:

Chloroplast Biogenesis Neil R. Baker, James Barber, 1984 *Division and Segregation of Organelles* Stephen A. Boffey, David Lloyd, 1988 These editors provide a stimulating survey of the ways in which mitochondria plastids and other cellular organelles replicate The orderly division and segregation of these organelles is essential for the survival of all eukaryotes and is therefore a topic of importance to a wide range of biologists from geneticists via physiologists to molecular biologists The first part of the volume examines the mechanism regulation and consequences of organelle segregation and division as studied in plant and animal cells The second part compares the replication of DNA in eukaryote organelles with bacterial processes Reviews range from a comparative study of DNA polymerases to the possible mechanisms ensuring DNA segregation

Subcellular Biochemistry Donald B. Roodyn, 2012-12-06 **Chloroplast Biogenesis** James Barber, Neil R. Baker, 1984 **Plant Organelles** Alyson K. Tobin, 1992-10-15 A comprehensive review of current research on the interaction of plant organelles in photosynthesis photorespiration substrate and protein transport respiration lipid metabolism and organelle biogenesis

Photosynthesis David W. Lawlor, 1993 Provides a simplified description of the partial process of photosynthesis at the molecular organelle cell and organ levels of organization in plants which contribute to the complete process It surveys effects of global environmental change carbon dioxide enrichment and ozone depletion

Compartmentation of Plant Metabolism in Non-Photosynthetic Tissues M. J. Emes, 1991-02-21 Many of the most important plant crop products including oils starch and protein are produced in non photosynthetic tissues such as seeds roots and tubers Unlike the situation found in leaves metabolism in these tissues is not necessarily dominated by plastidial activities and the provision of energy for biosynthetic processes is therefore different from that in green cells In this book leading researchers in the field present a fine overview of the latest thinking on the organisation of metabolism in such organs and the development of the cellular compartments responsible for the synthesis of important crop products Graduate students as well as researchers in the field of plant biochemistry will find this book of great interest

Cell Organelles Reinhold G. Herrmann, 2012-12-06 The compartmentation of genetic information is a fundamental feature of the eukaryotic cell The metabolic capacity of a eukaryotic plant cell and the steps leading to it are overwhelmingly an endeavour of a joint genetic cooperation between nucleus cytosol plastids and mitochondria Alter ation of the genetic material in anyone of these compartments or exchange of organelles between species can seriously affect harmoniously balanced growth of an organism Although the biological significance of this genetic design has been vividly evident since the discovery of non Mendelian inheritance by Baur and Correns at the beginning of this century and became indisputable in principle after Renner s work on interspecific nuclear plastid hybrids summarized in his classical article in 1934 studies on the genetics of organelles have long suffered from the lack of respectabil ity Non Mendelian inheritance was considered a research sideline ifnot a freak by most geneticists which becomes evident when one consults common textbooks For instance these have usually impeccable

accounts of photosynthetic and respiratory energy conversion in chloroplasts and mitochondria of metabolism and global circulation of the biological key elements C N and S as well as of the organization maintenance and function of nuclear genetic information In contrast the heredity and molecular biology of organelles are generally treated as an adjunct and neither goes as far as to describe the impact of the integrated genetic system

Plant Promoters and Transcription Factors Lutz Nover,2013-06-29 The control of plant gene expression at the transcriptional level is the main subject of this volume Genetics molecular biology and gene technology have dramatically improved our knowledge of this event The functional analysis of promoters and transcription factors provides more and more insights into the molecular anatomy of initiation complexes assembled from RNA polymerase and the multiplicity of helper and control proteins Formation of specific DNA protein complexes activating or repressing transcription is the crux of developmental or environmental control of gene expression The book presents an up to date critical overview of this rapidly advancing field

Control of Leaf Growth N. R. Baker,W. J. Davies,C. K. Ong,1985 First published in 1985 this book covers the physiological and environmental factors that regulate leaf growth It opens with a consideration of the importance to the plant of leaf size form and development and then divides naturally into two sections the first covers the intrinsic factors within the leaf that influence development including solute and hormonal status cellular components and energy transducing systems the second considers the role of some major environmental variables in the regulation of leaf growth including temperature light water and nutrients atmospheric influences and the interactive effects of climatic variables
