Springer Handbook of Global Navigation Satellite

Systems Peter Teunissen, Oliver Montenbruck, 2017-06-16. This Handbook presents a complete and rigorous overview of the fundamentals, methods and applications of the multidisciplinary field of Global Navigation Satellite Systems (GNSS), providing an exhaustive one-stop reference work and a state-of-the-art description of GNSS as a key technology for science and society at large. All global and regional satellite navigation systems, both those currently in operation and those under development (GPS, GLONASS, Galileo, BeiDou, QZSS, IRNSS, NAVIC, SBAS) are examined in detail. The functional principles of receivers and antennas, as well as the advanced algorithms and models for GNSS parameter estimation, are rigorously discussed. The book covers the broad and diverse range of land, marine, air and space applications from everyday GNSS to high-precision scientific applications and provides detailed descriptions of the most widely used GNSS format standards covering receiver formats as well as IGS product and meta-data formats. The full coverage of the field of GNSS is presented in seven parts: from its fundamentals through the treatment of global and regional navigation satellite systems, of receivers and antennas, and of algorithms and models up to the broad and diverse range of applications in the areas of positioning and navigation, surveying, geodesy and geodynamics, and remote sensing and timing. Each chapter is written by international experts and amply illustrated with figures and photographs, making the book an invaluable resource for scientists, engineers, students and institutions alike.

Digital Earth Moving Caroline Y. Westort, 2003-06-30. Digital manipulation of landform is revolutionizing how our built environment is designed and constructed. On a technical level, three-dimensional geometric modeling of topography has its origins at the interface of geographic information systems (GIS) and computer-aided geometric modeling (CAD). The former with its representations of spatial attribute information with digital terrain in several representations (Triangulated Irregular Networks, contour lines, etc.) the latter focusing primarily on the parameterization and combination of geometric primitives. The broadening of these two disciplines to embrace new surveying and navigation advances (e.g. global positioning systems, GPS) together with developments in engineering on the application side are leading to powerful new suites of functionality. There has been a pronounced need for a forum where these traditionally separate parties can interact. These proceedings contain the technical papers selected and formally presented as part of the scientific program of the First

International Symposium on Digital Earth Moving 2001 DEM 2001 held September 5 7 2001 at the CIM Institute for Computing Science and Industrial Technologies of the University of Applied Science of Southern Switzerland SUPSI iCIMS in Manno Lugano Switzerland It is the first volume published on this explicit theme Thirty six submissions were received from fifteen countries with thirteen select papers and posters presented in the official program and in this publication
