

Modern trends in Harmonic Analysis

The goal of this program is to introduce some of the path breaking developments in harmonic analysis in recent years. In particular, the program is focused on polynomial methods in harmonic analysis and discrete harmonic analysis.

Polynomial methods in harmonic analysis: In the recent years there have been remarkable developments in the direction of Fourier restriction and Bochner-Riesz conjectures using the polynomial method. This method involves using tools from algebraic geometry to solve problems in various areas of mathematics. In particular, the method has been fruitful in addressing outstanding open problems in harmonic analysis.

Discrete harmonic analysis: The discrete analogues in harmonic analysis with connections to number theoretic problems have been an active area of research in harmonic analysis. It is quite remarkable that in the recent years the powerful technique of sparse domination in the continuous setting has been developed to address problems related to discrete averages and the corresponding maximal functions.

There will be a dedicated lecture series on each of the above topics by the experts. These lectures will provide an introduction to the above methods in a self contained manner. One of the major aims of the lectures is to give an overview of these new techniques in solving problems related to harmonic analysis. Further some future prospects will also be discussed involving polynomial methods and discrete harmonic analysis. The program will help participants in following the recent developments in the field and undertake research projects in these exciting areas of harmonic analysis.

Thematic Lectures:

Theme 1 : Sharp restriction estimates

Speaker : Diogo Oliveira e Silva

Theme 2 : Quadrature rules on manifolds

Speaker : Giacomo Gigante

Theme 3 : Discrete harmonic analysis

Speaker : Michael Lacey

The program will also feature invited research talks with a focus on the above themes of the program.

Eligibility Criteria: All mathematicians are welcome. Preference will be given to researchers who work in areas related to the themes of the workshop.

Agterberg, 2014-07-14 This book provides a wealth of geomathematical case history studies performed by the author during his career at the Ministry of Natural Resources Canada, Geological Survey of Canada, NRCan, GSC. Several of the techniques newly developed by the author and colleagues that are described in this book have become widely adopted not only for further research by geomathematical colleagues but by government organizations and industry worldwide. These include Weights of Evidence modelling, mineral resource estimation, technology trend surface analysis, automatic stratigraphic correlation and nonlinear geochemical exploration methods. The author has developed maximum likelihood methodology and spline fitting techniques for the construction of the international numerical geologic timescale. He has introduced the application of new theory of fractals and multi-fractals in the geostatistical evaluation of regional mineral resources and ore reserves and to study the spatial distribution of metals in rocks. The book also contains sections deemed important by the author but that have not been widely adopted because they require further research. These include the geometry of preferred orientations of contours and edge effects on maps, time series analysis of Quaternary retreating ice sheet related sedimentary data, estimation of first and last appearances of fossil taxa from frequency distributions of their observed first and last occurrences, tectonic reactivation along pre-existing schistosity planes in fold belts, use of the grouped jackknife method for bias reduction in geometrical extrapolations and new applications of the theory of permanent volume independent frequency distributions.
