

Theoretical Probability

The **theoretical probability** of an event occurring is

$$\text{Theoretical probability} = \frac{\text{frequency of the event occurring}}{\text{total frequency of possible outcomes}}$$

Mutually exclusive events cannot happen at the same time.

For example, a fair die cannot land on a 3 and a 4 at the same time and a coin flip cannot land on heads and tails at the same time.

If an object (a coin, spinner, or dice for example) is described as fair, or conversely non-biased, the theoretical probability of each outcome is the same; the theoretical probability of flipping a tails on a fair coin is $\frac{1}{2}$, the **theoretical probability** of rolling a 2 on a fair 6-sided dice is $\frac{1}{6}$.

The Cumulative Book Index ,1959 **Cumulated Index to the Books** ,1963 *Exploring RANDOMNESS* Gregory J. Chaitin,2012-12-06 In *The Unknowable* I use LISP to compare my work on incompleteness with that of Gödel and Turing and in *The Limits of Mathematics* I use LISP to discuss my work on incompleteness in more detail In this book we ll use LISP to explore my theory of randomness called algorithmic information theory AIT And when I say explore I mean it This book is full of exercises for the reader ranging from the mathematical equivalent of trivial finger warm ups for pianists to substantial programming projects to questions I can formulate precisely but don't know how to answer to questions that I don't even know how to formulate precisely I really want you to follow my example and hike off into the wilderness and explore AIT on your own You can stay on the trails that I've blazed and explore the well known part of AIT or you can go off on your own and become a fellow researcher a colleague of mine One way or another the goal of this book is to make you into a participant not a passive observer of AIT In other words it's too easy to just listen to a recording of AIT that's not the way to learn music
