Extending in Vivo Half-life of Therapeutic Proteins (L-11944). National Research Council Canada, 2017 Post translational modifications of therapeutic proteins are commonly made to improve their circulating half life thereby enhancing their efficiency Numerous strategies have been employed towards this end including covalent modification such as through PEGylation the chemical addition of chains of polyethylene glycol PEG to therapeutic proteins However PEGylation relies on chemical conjugation of PEG chains to free amino groups or engineered cysteine residues on the protein which can lead to heterogeneously modified proteins whose activity can be adversely affected To address this the NRC has developed a site specific two step in vitro modification process whereby polysialic acid PSA is enzymatically added to existing glycans resulting in proteins with greater stability solubility and circulating half life Highlights **Novel Therapeutic Proteins** Klaus Dembowski, Peter Stadler, 2008 This book describes medical applications of recombinant proteins and monoclonal antibodies some of which have already been on the market for several years while others have only recently been launched It also highlights the manufacturing processes for individual products the strategies that were taken by companies in the clinical development and the hurdles that were encountered in clinical trials and had to be overcome before approval by regulatory authorities Finally this book illustrates strategies to modify and improve the pharmacodynamic and pharmacokinetic properties of naturally occurring proteins thus paving the way for a new era in biotechnology
