Marine Environmental Characterization C. Reid Nichols, Kaustubha Raghukumar, 2022-06-01 The use of environmental data to support science technology and marine operations has evolved dramatically owing to long term ocean observatories unmanned platforms satellite and coastal remote sensing data assimilative numerical models and high speed communications Actionable environmental information is regularly produced and communicated from quality controlled measurements and skillful forecasts The characterization of complex oceanographic processes is more difficult compared to inland features because of the difficulty in obtaining observations from often remote and hazardous locations Regardless coastal and ocean engineering projects and operations require the collection and analysis of meteorological and oceanographic data to fill information gaps and the running of numerical models to characterize regions of interest Data analytics are also essential to integrate disparate marine data from national archives in situ sensors imagery and numerical models to meet project requirements Holistic marine environmental characterization is essential for data driven decision making across the science and engineering lifecycle e g research production operations end of life Many marine science and technology projects require the employment of an array of instruments and models to characterize spatially and temporally variable processes that may impact operations Since certain environmental conditions will contribute to structural damage or operational disturbances they are described using statistical parameters that have been standardized for engineering purposes The statistical description should describe extreme conditions as well as long and short term variability These data may also be used to verify and validate models and simulations Environmental characterization covers the region where engineering projects or maritime operations take place For vessels that operate across a variety of seaways marine databases and models are essential to describe environmental conditions Data which are used for design and operations must cover a sufficiently long time period to describe seasonal to sub seasonal variations multi year decadal multi decadal and even climatological factors such as sea level rise coastal winds waves and global ocean temperatures Combined data types are essential for the computation of environmental loads for the region of interest Typical factors include winds waves currents and tides Some regions may require consideration of biofouling earthquakes ice salinity soil conditions temperature tsunami and visibility Observations are also used for numerical forecasts but errors may exist due to inexact physical assumptions and or inaccurate initial data which can cause errors to grow to unacceptable levels with increased forecasting times Overall marine environmental characterization tools from observational data to numerical modeling are critical to today s science engineering and marine operational disciplines
