Urban Stormwater Modeling And Simulation:

Urban Stormwater Modeling and Simulation Stephan J. Nix, 1994-07-13 Urban Stormwater Modeling and Simulation discusses several popular stormwater models and explains a variety of uses in practical terms This unique book is divided into five key sections and begins with a description of urban runoff problems and how computer models play an important role in problem solving The book continues with detailed discussions on the construction of watershed models model verification and validation the use of models for predicting stormwater runoff and pollution discharges and common problems associated with popular modeling programs A practical approach is used throughout the book focusing on actual applications to illustrate basic principles This is the first book available that provides both new and experienced engineers consultants and scientists with an organized approach to stormwater modeling and simulation model construction model verification and software selection Water quality professionals environmental engineering students technical libraries regulators and planners will also find this a perfect hands on learning tool Urban Stormwater Management Planning with Analytical Probabilistic Models Barry J. Adams, Fabian Papa, 2000-03-27 Understanding how to properly manage urban stormwater is a critical concern to civil and environmental engineers the world over Mismanagement of stormwater and urban runoff results in flooding erosion and water quality problems In an effort to develop better management techniques engineers have come to rely on computer simulation and advanced mathematical modeling techniques to help plan and predict water system performance This important book outlines a new method that uses probability tools to model how stormwater behaves and interacts in a combined or single system municipal water system Complete with sample problems and case studies illustrating how concepts really work the book presents a cost effective easy to master approach to analytical modeling of stormwater management systems Advances in Modeling the Management of Stormwater Impacts William James, 1996-01-01 Why bother documenting conference proceedings Simple accountability What we are doing to the environment today and the arguments we use to justify it will seem incomprehensible in the future This popular series demonstrates state of the art methods models and techniques for water quality management and related environmental issues The material is peer reviewed for readability as well as merit The coverage is multidisciplinary and includes many opposing views Features **Comparative Analysis of Urban Stormwater Models** Albin Brandstetter, 1974 Eighteen mathematical models for the nonsteady simulation of runoff in urban storm and combined sewerage systems were reviewed in a study sponsored by the U S Environmental Protection Agency The models were evaluated on the basis of information published by the model builders and model users Seven models were also tested by computer runs using both hypothetical and real catchment data Most of the models evaluated include the nonsteady simulation of the rainfall runoff process and flow routing in sewers a few also include the simulation of wastewater quality options for dimensioning sewerage system components and features for realtime control of overflows during rainstorms **Development of Analytical Probabilistic**

Urban Stormwater Models Yiping Guo,1998 Analytical probabilistic urban stormwater models are closed form mathematical equations relating statistical urban drainage system performance measures directly to meteorological parameters system properties and design variables These equations are formulated using derived probability distribution theory with simplified representations of the hydrologic and hydraulic processes taking place on urban catchments The purpose of this thesis is to improve the representation of the hydrologic and hydraulic processes by existing analytical probabilistic models and to extend their use to flood control analyses In developing the new set of analytical probabilistic models the rainfall runoff transformation on an event basis is described by equations which incorporate the hydrologic processes commonly considered in numerical simulation models The peak discharge rate of a runoff event is estimated from the runoff event volume the duration of the causal rainfall event and the catchment time of concentration The average catchment time of concentration is used for all runoff events and is treated as a physical characteristic of the urban catchment independent of input rainfall characteristics Incorporating the exponential probability density functions of rainfall event characteristics closed form analytical expressions are derived for the return periods of runoff event volume and peak discharge rate of urban catchments Furthermore the water quality control performance of urban stormwater detention ponds are analyzed Analytical expressions are derived for estimating the flow capture efficiency and average detention time provided by a stormwater quality control detention pond servicing an urban catchment Taking into account the variable inflow and outflow rates the detention ponds considered are those where outflow is controlled by an orifice type structure The flow capture efficiency is determined with the estimation of the total spill volume The total spill volume is calculated as the combination of the event spill volume and the carryover spill volume Thus the carryover effect of consecutive runoff events is quantified The analytical probabilistic approach is further extended to flood control analyses with the derivation of the probability distribution of the peak outflow rate from a flood control detention facility servicing an urban catchment The derived mathematical expressions are used to analytically determine the storage discharge relationship required for a detention facility to achieve the desired level of flood control Continuous simulation of various urban catchments and detention pond configurations are conducted using Toronto historical rainfall records Close agreement is obtained between simulation model results and those from the analytical probabilistic models developed in this thesis Thus the analytical probabilistic models can be used as an alternative to or together with continuous simulation models for the planning and design of urban stormwater management facilities

Liu,Zhan Tian,Qinhua Ye,Laixiang Sun,Shiqiang Wu,2024-02-23 Water plays an essential role in the development and functioning of a city but could also be a key risk factor for urban pluvial flooding which may occur more frequently in the context of future climate change The traditional means of flood risk management relied heavily on engineering measures or the use of gray infrastructure Recently there has been a call to integrate nature based solutions NBS which make use of natural processes and ecosystem services with conventional engineering approaches NBS infrastructures and designs pay great attention to ecosystem services considerations in assessing their induced hydrological processes as well as in managing the stormwater and mitigating urban flood and droughts Nevertheless compared with grey infrastructure larger space could be demanded for NBS while the buffer effect for NBS in extremes events is still uncertain for evaluation *Selected Water Resources Abstracts* ,1987 *Urban Stormwater Hydrology* David F.
