Industrial Parsing of Software Manuals Richard F.E. Sutcliffe, 2023-11-27 The task of language engineering is to develop the technology for building computer systems which can perform useful linguistic tasks such as machine assisted translation text retrieval message classification and document summarisation Such systems often require the use of a parser which can extract specific types of grammatical data from pre defined classes of input text There are many parsers already available for use in language engineering systems However many different linguistic formalisms and parsing algorithms are employed Grammatical coverage varies as does the nature of the syntactic information extracted Direct comparison between systems is difficult because each is likely to have been evaluated using different test criteria In this volume eight different parsers are applied to the same task that of analysing a set of sentences derived from software instruction manuals Each parser is presented in a separate chapter Evaluation of performance is carried out using a standard set of criteria with the results being presented in a set of tables which have the same format for each system Three additional chapters provide further analysis of the results as well as discussing possible approaches to the standardisation of parse tree data Five parse trees are provided for each system in an appendix allowing further direct comparison between systems by the reader The book will be of interest to students researchers and practitioners in the areas of computational linguistics computer science information retrieval language engineering linguistics and machine assisted translation

Parallel Text Processing Jean Véronis, 2013-03-14 | This book evolved from the ARCADE evaluation exercise that started in 1995 The project's goal is to evaluate alignment systems for parallel texts i.e. texts accompanied by their translation Thirteen teams from various places around the world have participated so far and for the first time some ten to fifteen years after the first alignment techniques were designed the community has been able to get a clear picture of the behaviour of alignment systems Several chapters in this book describe the details of competing systems and the last chapter is devoted to the description of the evaluation protocol and results The remaining chapters were especially commissioned from researchers who have been major figures in the field in recent years in an attempt to address a wide range of topics that describe the state of the art in parallel text processing and use As I recalled in the introduction the Rosetta stone won eternal fame as the prototype of parallel texts but such texts are probably almost as old as the invention of writing Nowadays parallel texts are electronic and they are becoming an increasingly important resource for building the natural language processing tools needed in the multilingual information society that is currently emerging at an incredible speed Applications are numerous and they are expanding every day multilingual lexicography and terminology machine and human translation cross

Buhr,2016-09-24 The control flow issues presented in this textbook are extremely relevant in modern computer languages and programming styles In addition to the basic control flow mechanisms virtually all new computer languages provide some form of exceptional control flow to support robust programming introduced in this textbook Also concurrency capabilities are appearing with increasing frequency in both new and old programming languages and are covered in this book

Understanding Control Flow With Concurrent Programming Using C starts with looping and works through each of the basic control flow concepts examining why each is fundamental and where it is useful Time is spent on each concept according to its level of difficulty Examples and exercises are also provided in this textbook New programming methodologies are requiring new forms of control flow and new programming languages are supporting these methodologies with new control structures such as the concurrency constructs discussed in this textbook Most computers now contain multi threading and multi cores while multiple processors and distributed systems are ubiquitous all of which require advanced programming methodologies to take full advantage of the available parallelism summarized in this textbook Advance forms of control flow are becoming basic programming skills needed by all programmers not just graduate students working in the operating systems or database disciplines This textbook is designed for advanced level students studying computer science and engineering Professionals and researchers working in this field specifically programming and software engineering will find this book useful as a reference
