Thermal Analysis Of Rubbers And Rubbery Materials:

Thermal Analysis of Rubbers and Rubbery Materials Namita Roy Choudhury, Prajna P. De, Naba K. Dutta, 2010
Thermal analysis is a group of techniques in which a physical property of a substance is measured as a function of temperature while the substance is subjected to a controlled temperature programme. In differential thermal analysis the temperature difference that develops between a sample and an inert reference material is measured when both are subjected to identical heat treatments. The related technique of differential scanning calorimetry relies on differences in energy required to maintain the sample and reference at an identical temperature. This book describes the use of this technique for determining additives in rubbery materials in recycling of rubbers and in understanding the interactions of rubber fillers and the rubber matrix. It also explains characterisation of rubber nanocomposites and other modified rubbers and their blends as well as examining instrumental techniques and crystallisation of rubbers. This book will prove invaluable reading for anyone involved in material and product development, testing, processing, quality assurance or failure analysis in industry and laboratories.

Spectroscopy of Rubbers and Rubbery Materials Victor M. Litvinov, Prajna P. De, 2002
This book deals with the application of spectroscopic techniques for characterisation of chemical and physical structures in viscoelastic materials such as unvulcanised elastomers and their vulcanisates. Various rubbery materials and some plastics which when blended with particular additives (plasticisers) behave like rubbers. Analysis of the rubbery materials is complicated by the fact that rubbery products such as tyres, tubes, seals, V belts and hoses contain in the rubbery matrix a significant amount of various compounds, i.e. fillers, vulcanising agents, antioxidants and plasticisers. Due to the complex composition, no single technique can provide a good understanding of the effect of chemical and physical structures on the functional properties of rubbery materials. Thus, spectroscopy has become a powerful tool for the determination of polymer structures. The most comprehensive information on chemical and physical structures in relation to material properties can be obtained by using a combination of macroscopic techniques and methods that provide information on the molecular level. Frequently used for analysis of rubbery materials, i.e. various methods of nuclear magnetic resonance (NMR) and optical spectroscopy. The main objective of this present book is to discuss a wide range of applications of the spectroscopic techniques for the analysis of rubbery materials. The book brings together the various spectroscopic techniques for obtaining the following information: chemical structure of rubbery materials, network structure analysis, heterogeneity of rubbery materials, physical properties of rubbery materials, functional properties and stability of rubbery materials, processing of rubbery materials and quality control. The contents of this book are of interest to chemists, physicists, material scientists and technologists who seek a better understanding of rubbery materials.

Varma, A. C. Momin, 1989 *Principles and Applications of Thermal Analysis* Paul Gabbott, 2008 Thermal Analysis techniques are used in a wide range of disciplines from pharmacy and foods to polymer science materials and glasses in fact any field where changes in sample behaviour are observed under controlled heating or controlled cooling conditions The wide range of measurements possible provide fundamental information on the material properties of the system under test so thermal analysis has found increasing use both in basic characterisation of

materials and in a wide range of applications in research development and quality control in industry and academia Principles and Applications of Thermal Analysis is written by manufacturers and experienced users of thermal techniques It provides the reader with sound practical instruction on how to use the techniques and gives an up to date account of the principle industrial applications By covering basic thermogravimetric analysis TGA differential scanning calorimetry DSC including the new approach of Fast Scanning DSC together with dynamic mechanical analysis DMA TMA methods then developing the discussion to encompass industrial applications the book serves as an ideal introduction to the technology for new users With a strong focus on practical issues and relating the measurements to the physical behaviour of the materials under test the book will also serve as an important reference for experienced analysts
