Sergei Vasil'evich Kerov, This book reproduces the doctoral thesis written by a remarkable mathematician Sergei V Kerov His untimely death at age 54 left the mathematical community with an extensive body of work and this one of a kind monograph Here he gives a clear and lucid account of results and methods of asymptotic representation theory The book is a unique source of information on an important topic of current research Asymptotic representation theory of symmetric groups deals with problems of two types asymptotic properties of representations of symmetric groups of large order and representations of the limiting object i e the infinite symmetric group The author contributed significantly in the development of both directions His book presents an account of these contributions as well as those of other researchers Among the problems of the first type the author discusses the properties of the distribution of the normalized cycle length in a random permutation and the limiting shape of a random with respect to the Plancherel measure Young diagram He also studies stochastic properties of the deviations of random diagrams from the limiting curve Among the problems of the second type Kerov studies an important problem of computing irreducible characters of the infinite symmetric group This leads to the study of a continuous analog of the notion of Young diagram and in particular to a continuous analogue of the hook walk algorithm which is well known in the combinatorics of finite Young diagrams In turn this construction provides a completely new description of the relation between the classical moment problems of Hausdorff and Markov The book is suitable for graduate students and research mathematicians interested in representation theory and combinatorics

MANAGING

NATURAL RESOURCES MISRA, HARIKESH N. ,2014-03-13 Natural resource management and sustainable development has

of late assumed great importance especially because of ecological crisis and environmental dangers which are looming large. Today the issues related to natural resource exploitation, consequences, their conservation, preservation and management leading to sustainable development have become the major thrust areas of teaching and research. Also sustainability of natural resources, especially water and land resources and their efficient use is one of the core programmes of Government of India's Twelfth Five Year Plan 2012-2017. For strategic development, this objective can only be achieved if the resources are used judiciously. Although land and water resources, the focus of the present book, are vital for human survival and development, unfortunately both are under threat and are increasing strain worldwide. These resources have wide and significantly varying implications in rural and urban settlements, especially in India where population has been continuously growing and therefore the demand of land and water is intensifying. This has necessitated urgent need for reviewing the availability of land and water resources and their conservation. Besides dealing with the theoretical aspects, this compendium presents case studies on natural resources as well which reveal ground realities at micro and meso levels too. Pedagogical features like maps, diagrams, satellite imageries and latest database of the primary and secondary nature distinguish this book from other works on the subject. The book will be of immense use to postgraduate students and research scholars of geography and related disciplines such as rural urban studies and environmental science. The thematic approach of the book provides reasonably good contents for cogitation to researchers. Policy makers, planners and academicians may also be benefitted while framing futuristic norms which may lead to sustainable development, the ultimate goal. AUDIENCE

*Sampling Theory for Forest Inventory* Pieter G. de Vries, 2012-12-06 Forest inventory may be defined as the technique of collecting, evaluating and presenting specified information on forest areas. Because of the generally large extent of forest areas, data are usually collected by sampling, i.e. by making observations on only part of the area of interest. As there are many different sampling methods, e.g. Appendix 1, a choice must first be made as to which method suits the given field and financial circumstances best. On completion of the sampling procedure, the numerous data collected have next to be condensed to manageable representative quantities. Finally, from these quantities, inferences about the situation in the entire forest area are made, preferably accompanied by an indication of their reliability. This book is intended for students who want to know the wherewithal of the sampling techniques used in forest inventory. The danger of lack of knowledge is a blind following of instructions and copying statistical formulae or even worse, feeding data into a computer loaded with a program that is said to print out the required information. In serious persons, such approaches may leave a feeling of dissatisfaction or even of professional incompetence because of inability to direct or evaluate the procedure critically. If a student tries to improve his or her situation, he/she will find that the few existing forest inventory

textbooks though some with merit either use confusing statistical symbols or do not adequately cover theoretical principles
