
1.1 Introduction

Water resource systems have benefited both people and their economies for many centuries. The services provided by such systems are multiple. Yet in many regions of the world they are not able to meet even basic drinking water and sanitation needs. Nor can many of these water resource systems support and maintain resilient biodiverse ecosystems. Typical causes include inappropriate, inadequate and/or degraded infrastructure, excessive withdrawals of river flows, pollution from industrial and agricultural activities, eutrophication resulting from nutrient loadings, salinization from irrigation return flows, infestations of exotic plant and animals, excessive fish harvesting, flood plain and habitat alteration from development activities, and changes in water and sediment flow regimes. The inability of water resource systems to meet the diverse needs for water often reflect failures in planning, management, and decision-making—and at levels broader than water. Planning, developing, and managing water resources to ensure adequate, inexpensive, and sustainable supplies and qualities of water for both humans and natural ecosystems can only succeed if we recognize and address the causal socioeconomic factors, such as inadequate education, corruption, population pressures, and poverty.

Over the centuries, surface and ground waters have been a source of water supply for agricultural, municipal, and industrial consumers. Rivers have provided hydroelectric energy and inexpensive

ways of transporting bulk cargo. They have provided people water-based recreational opportunities and have been a source of water for wildlife and their habitats. They have also served as a means of transporting and transforming waste products that are discharged into them. The quantity and quality regimes of streams and rivers have been a major factor in governing the type, health, and biodiversity of riparian and aquatic ecosystems. Floodplains have provided fertile lands for agricultural crop production and relatively flat lands for the siting of roads and railways and commercial and industrial complexes. In addition to the economic benefits that can be derived from rivers and their floodplains, the aesthetic beauty of most natural rivers has made lands adjacent to them attractive sites for residential and recreational development. Rivers and their floodplains have generated, and, if managed properly, can continue to generate, substantial cultural, economic, environmental, and social benefits for their inhabitants.

Human activities undertaken to increase the benefits obtained from rivers and their floodplains may also increase the potential for costs and damages such as when the river is experiencing periods of droughts, floods, and heavy pollution. These costs and damages are physical, economic, environmental, and social. They result because of a mismatch between what humans expect or demand, and what nature offers or supplies. Human activities tend to be based on the “usual or normal” range of river flow conditions. Rare or “extreme” flow conditions

This book is divided into four parts The first part Preliminaries begins by introducing the basic theme of the book It provides an overview of the current status of water resources utilization the likely scenario of future demands and advantages and disadvantages of systems techniques An understanding of how the hydrological data are measured and processed is important before undertaking any analysis The discussion is extended to emerging techniques such as Remote Sensing GIS Artificial Neural Networks and Expert Systems The statistical tools for data analysis including commonly used probability

distributions parameter estimation regression and correlation frequency analysis and time series analysis are discussed in a separate chapter Part 2 Decision Making is a bouquet of techniques organized in 4 chapters After discussing optimization and simulation the techniques of economic analysis are covered Recently environmental and social aspects and rehabilitation and resettlement of project affected people have come to occupy a central stage in water resources management and any good book is incomplete unless these topics are adequately covered The concept of rational decision making along with risk reliability and uncertainty aspects form subject matter of a chapter With these analytical tools the practitioner is well equipped to take a rational decision for water resources utilization Part 3 deals with Water Resources Planning and Development This part discusses the concepts of planning the planning process integrated planning public involvement and reservoir sizing The last part focuses on Systems Operation and Management After a resource is developed it is essential to manage it in the best possible way Many dams around the world are losing some storage capacity every year due to sedimentation and therefore the assessment and management of reservoir sedimentation is described in details No analysis of water resources systems is complete without consideration of water quality A river basin is the natural unit in which water occurs The final chapter discusses various issues related to holistic management of a river basin
