Uncertainty and Ground Conditions: A Risk Management Approach Martin Th. van Staveren, 2006-08-14 All civil engineering and construction projects require some sort of solid foundation but ground conditions bring some degree of uncertainty to every project Dealing properly with uncertainty over ground conditions can make the difference between the commercial success and failure of a project With margins in the construction industry at historic lows and with costs of failing to accurately predict ground conditions becoming increasingly high the importance of proper management of the variety of ground related risk is paramount Risk management has demonstrated its value in many industries but the full lessons of that experience has not yet fully reached all aspects of civil engineering In particular the importance of individuals and their own awareness of risks and how to manage them has often been overlooked Martin van Staveren has written a new kind of book on ground risk management Based on many years of professional experience and proven risk management techniques **Uncertainty and Ground Conditions** demonstrates how to ensure the construction and civil engineering projects succeed in delivering on time and on budget

Nowadays demands on modern civil engineering structures require not only safe technical solutions but also additional approaches involving ecological sociological and economical aspects This book reacts on these new requirements with a focus on earth structures for transport engineering mainly for motorways and railways Technical demands have to be adequately related to the risk with which the design and execution are connected Soil used for the construction together with subsoil are natural materials with a high degree of inhomogeneity Therefore the risk when constructing with such materials is much higher than for structures utilizing man made materials The engineering approach is firstly focused on the geotechnical risk identification and subsequently on the reduction of this risk Geotechnical risk is linked to the uncertainties for individual phases of the design and construction processes Ground model geotechnical design model calculation model and structure execution are the main phases of the above mentioned processes Risk reduction involves the lowering of the range of uncertainties for individual phases guaranteeing safe and optimal technical solutions Eurocode 7 Geotechnical design creates a general frame of this risk identification and reduction approach Earth structures are offering great opportunities for sustainability approach Therefore the possibilities how to decrease consumption of land greenfields energy and natural aggregates are at the centre of interest In parallel to sustainability the principles of availability and affordability for transport infrastructures are discussed The main aim there is to eliminate the impact of interaction of the transport infrastructure with natural and man made hazards thus guaranteeing long term functionality This book will be of interest to specialists responsible for transport infrastructure planning investors project owners of motorways and railways and environmental engineers The main focus is on those responsible for geotechnical investigations earth structures design and on contractors of such structures

Earth Structures Ivan Vanicek, Martin Vanicek, 2008-05-30 One of the plausible perceptions about safe and generally optimal geotechnical structure leads to the conclusion that its success is supported by four columns The first column relies on the understanding of natural sciences such as Geology Engineering Geology and Hydrogeology on one side and on the understanding of Mechanics Theory of Elasticity on the other side The second column relies on the application of existing findings on the behaviour of soils and rocks under different stress strain states we are speaking about support from Soil Mechanics and Rock Mechanics The third column relies on the combination of the theoretical findings with practical technologies during execution of Foundation Engineering and Underground Structures Tunnelling Finally the fourth column relies on a certain feeling of geological environment which Terzaghi 1959 denotes as capacity for judgment and he specifies that this capacity can be gained only by years of contact with field conditions The authors are confident that the third column relevant to practical application should be strengthened about Earth Structures about application on structures which belong to the oldest engineering structures utilizing the fundamental structural material soil At the same time they believe that Earth Structures will establish their position in the near future as it is gaining another interesting field which Earth Structures are also part of namely the field of Environmental Geotechnics
