*Pediatric Neurology Part I* Carol L. Richards, Francine Malouin, 2013-04-24 Over the last 25 years the definition and classification of cerebral palsy CP have evolved as well as the approach to rehabilitation CP is a disorder of the development of movement and posture causing activity limitations attributed to nonprogressive disturbances of the fetal or infant brain that may also affect sensation perception cognition communication and behavior Motor control during reaching grasping and walking are disturbed by spasticity dyskinesia hyperreflexia excessive coactivation of antagonist muscles retained developmental reactions and secondary musculoskeletal malformations together with paresis and defective programming Weakness and hypoextensibility of the muscles are due not only to inadequate recruitment of motor units but also to changes in mechanical stresses and hormonal factors Two methods the General Movements Assessment and the Test of Infant Motor Performance now permit the early detection of CP while the development of valid and reliable outcome measures particularly the Gross Motor Function Measure GMFM have made it possible to evaluate change over time and the effects of clinical interventions The GMFM has further led to the development of predictive curves of motor function while the Gross Motor Classification System and the Manual Ability Classification System provide standardized means to classify the severity of the movement disability With the emergence of the task oriented approach the focus of therapy in rehabilitation has shifted from eliminating deficits to enhancing function across all performance domains by emphasizing fitness function participation and quality of life There is growing evidence supporting selected interventions and interest for the therapy and social integration of adults with CP

**Pediatric Neurology, Part I** Olivier Dulac, Maryse Lassonde, Harvey B. Sarnat, 2013-04-24 The child is neither an adult miniature nor an immature human being at each age it expresses specific abilities that optimize adaptation to its environment and development of new acquisitions Diseases in children cover all specialties encountered in adulthood and neurology involves a particularly large area ranging from the brain to the striated muscle the generation and functioning of which require half the genes of the whole genome and a majority of mitochondrial ones Human being nervous system is sensitive to prenatal aggression is particularly immature at birth and development may be affected by a whole range of age dependent disorders distinct from those that occur in adults Even diseases more often encountered in adulthood than childhood may have specific expression in the developing nervous system The course of chronic neurological diseases beginning before adolescence remains distinct from that of adult pathology not only from the cognitive but also motor perspective right into adulthood and a whole area is developing for adult neurologists to care for these children with persisting neurological diseases when they become adults Just as pediatric neurology evolved as an identified specialty as the volume and complexity of data became too much for the general pediatrician or the adult neurologist to master the discipline has now continued to evolve into so many subspecialties such as epilepsy neuromuscular disease stroke malformations

neonatal neurology metabolic diseases etc that the general pediatric neurologist no longer can reasonably possess in depth expertise in all areas particularly in dealing with complex cases Subspecialty expertise thus is provided to some trainees through fellowship programmes following a general pediatric neurology residency and many of these fellowships include training in research Since the infectious context the genetic background and medical practice vary throughout the world this diversity needs to be represented in a pediatric neurology textbook Taken together and although brain malformations H Sarnat P Curatolo 2007 and oncology W Grisold R Soffietti are covered in detail in other volumes of the same series and therefore only briefly addressed here these considerations justify the number of volumes and the number of authors who contributed from all over the world Experts in the different subspecialties also contributed to design the general framework and contents of the book Special emphasis is given to the developmental aspect and normal development is reminded whenever needed brain muscle and the immune system The course of chronic diseases into adulthood and ethical issues specific to the developing nervous system are also addressed A volume in the Handbook of Clinical Neurology series which has an unparalleled reputation as the world's most comprehensive source of information in neurology International list of contributors including the leading workers in the field Describes the advances which have occurred in clinical neurology and the neurosciences their impact on the understanding of neurological disorders and on patient care **Orthopaedic**
