

A-2 MEASUREMENT AND UNCERTAINTY ANALYSIS (Manual)

OBJECTIVES:

- 1) To understand standard error determination
- 2) To understand standard error propagation
- 3) To understand determination of standard deviation/standard error
- 4) To understand standard uncertainty analysis in a system
- 5) To understand significant figures and their correct use
- 6) To know what is standard form

INTRODUCTION:

In your laboratory work in this physics course you will observe that when you make a certain measurement a numerical reading (measurement) is not exactly equal (from theory physics measurement is an exact measurement) to the underlying measurement (measured value) measurement that you make. It is this difference (and about 1% for some cases) for experimental (from the reality) of the world that we know. Hence, when you are doing in the experiment the measurement, it is important to know that you are doing the measurement from the theory.

Reasons of errors and uncertainties:

There are two main reasons for errors and uncertainties:

Systematic errors: These are the errors that are caused by the systematic errors. The systematic errors are the errors that are caused by the systematic errors. The systematic errors are the errors that are caused by the systematic errors. The systematic errors are the errors that are caused by the systematic errors.

Random errors: These are the errors that are caused by the random errors. The random errors are the errors that are caused by the random errors. The random errors are the errors that are caused by the random errors.

In your work in the physics course you will observe that all of these errors are not the same. Some are systematic errors and some are random errors. Some are systematic errors and some are random errors.

Accuracy versus Precision

In your work in the physics course you will observe that all of these errors are not the same. Some are systematic errors and some are random errors.

Accuracy refers to the closeness of the measured value to the true value. Precision refers to the closeness of the measured value to the measured value.

$$\text{Accuracy} = \frac{\text{Measured Value} - \text{True Value}}{\text{True Value}}$$

Precision is defined as the closeness of the measured value to the measured value.
