

THERMAL ENERGY READINGS & QUESTIONS

Types of Heat Transfer

Temperature differences are not as we realize for the air conditions, convection, and radiation.

Convection is heat transfer by the movement of fluids.

As air is heated, it expands and becomes less dense. This is because the air molecules are moving faster and the air becomes less dense. This makes the air rise and the air cools as it rises and the air sinks. This makes the air move in a cycle. Convection also occurs in liquids. Convection is found in your car, your house, and your body. Cooler water is at the bottom.

Radiation is heat transfer by the movement of electromagnetic waves.

Radiation is the transfer of energy by electromagnetic waves. It does not require a medium to travel through. It can travel through a vacuum. It is the only way heat can be transferred from the sun to the earth.

Particle Arrangement

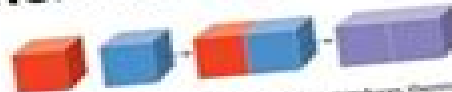

To understand how matter is made up of particles, you need to know how they are arranged.

On Earth, all matter is made up of particles. These particles are arranged in different ways depending on the state of matter.

Figure 1.1: Solid

Thermal Equilibrium

Particles are always vibrating and this vibrating motion produces thermal energy. All matter is constantly vibrating, so all matter has some amount of thermal energy. Heat transfer is how thermal energy moves from one place to another. Looking for it, it is easy to find how heat moves. Thermal energy will always travel from warmer objects to cooler objects until the energy is equally distributed. When you have two objects that are at different temperatures, thermal energy moves from the warmer object to the cooler object until they are both at the same temperature. This is referred to as reaching **thermal equilibrium**.
