Fluid and Thermodynamics Kolumban Hutter, Yongqi Wang, 2018-09-22 This third volume describes continuous bodies treated as classical Boltzmann and spin Cosserat continua or fluid mixtures of such bodies It discusses systems such as Boltzmann continua with trivial angular momentum and Cosserat continua with nontrivial spin balance and formulates the balance law and deformation measures for these including multiphase complexities Thermodynamics is treated in the spirit of Müller Liu it is applied to Boltzmann type fluids in three dimensions that interact with neighboring fluids on two dimensional contact surfaces and or one dimensional contact lines For all these situations it formulates the balance laws for mass momenta energy and entropy Further it introduces constitutive modeling for 3 2 3 d body parts for general processes and materially

objective variable sets and their reduction to equilibrium and non equilibrium forms Typical reduced fluid spin continua are liquid crystals Prominent nematic examples of these include the Ericksen Leslie Parodi ELP formulation in which material particles are equipped with material unit vectors directors Nematic liquid crystals with tensorial order parameters of rank 1 to n model substructure behavior better and for both classes of these the book analyzes the thermodynamic conditions of consistency Granular solid fluid mixtures are generally modeled by complementing the Boltzmann laws with a balance of fluctuation kinetic energy of the particles The book closes by presenting a full Reynolds averaging procedure that accounts for higher correlation terms e g a k epsilon formulation in classical turbulence However because the volume fraction is an additional variable the theory also incorporates k epsilon equations for the volume fraction **Lectures in**
