Scheduling Theory. Single-Stage Systems V. Tanaev, W. Gordon, Yakov M. Shafransky, 2012-12-06 Scheduling theory is an important branch of operations research Problems studied within the framework of that theory have numerous applications in various fields of human activity As an independent discipline scheduling theory appeared in the middle of the fifties and has attracted the attention of researchers in many countries In the Soviet Union research in this direction has been mainly related to production scheduling especially to the development of automated systems for production control In 1975 Nauka Science Publishers Moscow issued two books providing systematic descriptions of scheduling theory The first one was the Russian translation of the classical book Theory of Scheduling by American mathematicians R W Conway W L Maxwell and L W Miller The other one was the book Introduction to Scheduling Theory by Soviet mathematicians V S Tanaev and V V Shkurba These books well complement each other Both books well represent major results known by that time contain an exhaustive bibliography on the subject Thus the books as well as the Russian translation of Computer and Job Shop Scheduling Theory edited by E G Coffman Jr Nauka 1984 have contributed to the development of scheduling theory in the Soviet Union Many different models the large number of new results make it difficult for the researchers who work in related fields to follow the fast development of scheduling theory and to master new methods and approaches quickly

Scheduling Michael L. Pinedo, 2014-02-23 This new edition of the well established text Scheduling Theory Algorithms and Systems provides an up to date coverage of important theoretical models in the scheduling literature as well as significant scheduling problems that occur in the real world It again includes supplementary material in the form of slide shows from industry and movies that show implementations of scheduling systems The main structure of the book as per previous edition consists of three parts The first part focuses on deterministic scheduling and the related combinatorial problems The second part covers probabilistic scheduling models in this part it is assumed that processing times and other problem data are random and not known in advance The third part deals with scheduling in practice it covers heuristics that are popular with practitioners and discusses system design and implementation issues All three parts of this new edition have been revamped and streamlined The references have been made completely up to date Theoreticians and practitioners alike will find this book of interest Graduate students in operations management operations research industrial engineering and computer science will find the book an accessible and invaluable resource Scheduling Theory Algorithms and Systems will serve as an essential reference for professionals working on scheduling problems in manufacturing services and other environments

Reviews of third edition This well established text covers both the theory and practice of scheduling The book begins with motivating examples and the penultimate chapter discusses some commercial scheduling systems and examples of their implementations Mathematical Reviews 2009

Scheduling: Control-Based Theory and Polynomial-Time Algorithms K. Kogan, E. Khmelnitsky, 2013-11-27 This book presents a first attempt to systematically collect classify and solve various continuous time scheduling problems

The classes of problems distinguish scheduling by the number of machines and products production constraints and performance measures. Although such classes are usually considered to be a prerogative of only combinatorial scheduling literature, the scheduling methodology suggested in this book is based on two mathematical tools: optimal control and combinatorics. Generally considered as belonging to two totally different areas of research and application, these seemingly irreconcilable tools can be integrated in a unique solution approach with the advantages of both. This new approach provides the possibility of developing effective polynomial time algorithms to solve the generic scheduling problems. This book is aimed at a student audience: final year undergraduates as well as master and Ph D students primarily in Operations Research, Management, Industrial Engineering and Control Systems. Indeed, some of the material in the book has formed part of the content of undergraduate and graduate courses taught at the Industrial Engineering Department of Tel Aviv University, the Logistics Department of Bar Ilan University and the Technology Management Department of ROLON Center for Technological Education, Israel. The book is also useful for practicing engineers interested in planning, scheduling and optimization methods. Since the book addresses the theory and design of computer based scheduling algorithms, applied mathematicians and computer software specialists engaged in developing scheduling software for industrial engineering and management problems will find that the methods developed here can be embedded very efficiently in large applications. Symposium on the Theory of Scheduling and Its Applications, North Carolina State University, 1972 Salah Eldin Elmaghraby, 1973

Symposium on the Theory of Scheduling and Its Applications S. E. Elmaghraby, 1973-11-14. The theory of scheduling is receiving increased emphasis in research and practice for at least three good reasons. First, the management of large scale projects resolves itself in the final analysis into problems of scheduling interacting activities subject to limited resources. Second, a great deal of what used to exist in the past in production, distribution and service systems is eliminated thanks to tighter managerial controls in information systems, in financial management, in logistics and in many other facets of industrial enterprises and military installations. Tighter scheduling methods are therefore called for. Third, the study of scheduling problems involves the study of combinatorial problems and optimization over discrete spaces which represent a radical and interesting departure from classical mathematics. This area of study has attracted a good number of distinguished researchers: engineers as well as mathematicians. There is a serious attempt to apply known number theory and perhaps develop new theory that would cope with the new problems. The computer enters the picture in novel and ingenious ways which has not been possible before etc. To those working in the area, whether in theory or in practice, progress proceeds at an exhilarating pace with new mathematical structures and computational approaches being continuously introduced to model and solve the problems in novel and oftentimes ingenious ways. *Handbook on Scheduling* Jacek Blazewicz, Klaus H. Ecker, Erwin Pesch, Günter Schmidt, Malgorzata Sterna, Jan Weglarz, 2019-04-25. This handbook provides a comprehensive introduction to the theory and applications of scheduling in advanced planning and computer systems. It addresses a broad

audience including practitioners and researchers interested in scheduling as well as graduate and advanced undergraduate students in the fields of computer science and computer engineering operations research industrial and real time engineering management science business administration and information systems and applied mathematics The book begins by providing an introduction to and basic concepts from discrete mathematics Single and multiple processor systems are covered with a focus on multiprocessor tasks and hard real time systems Flow shop and open shop scheduling as well as scheduling in job shops are explained in detail Issues like limited processor availability time dependence resource constraints and imprecise computations are dealt with in dedicated chapters Special attention is given to online scheduling constraint programming and disjunctive scheduling The book also features applications and cases involving flexible manufacturing systems computer integrated production scheduling and logistics In particular it presents case studies on optimization procedures for the production of acrylic glass and of helicopter parts in a flexible manufacturing system an efficient decision support system for airport gate scheduling concrete delivery planning and berth and quay crane allocation at seaports

Scheduling Theory V. Tanaev, Yuri N. Sotskov, V.A. Strusevich, 2012-12-06 An increasing interest to scheduling theory can be attributed to the high level of automation of all branches of human activity The quality of modern production essentially depends on the planning decisions taken at different stages of a production process Moreover while the quality of these decisions is improving the time and flexibility requirements for decision making are becoming more important All this stimulates scheduling research Started as an independent discipline in the early fifties it now has become an important branch of operations research In the eighties the largest Russian publishing house for scientific literature Nauka Publishers Moscow issued two books by a group of Byelorussian mathematicians *Scheduling Theory Single Stage Systems* by V S Tanaev V S Gordon and Y M Shafransky 1984 and *Scheduling Theory Multi Stage Systems* by V S Tanaev Y N Sotskov and V A Strusevich 1989 Originally published in Russian these two books cover two different major problem areas of scheduling theory and can be considered as a two volume monograph that provides a systematic and comprehensive exposition of the subject The authors are grateful to Kluwer Academic Publishers for creating the opportunity to publish the English translations of these two books We are indebted to M Hazewinkel J K Lenstra A H G Rinnooy Kan D B Shmoys and W Szwarc for their supporting the idea of translating the books into English

Multicriteria Scheduling Vincent T'Kindt, Jean-Charles Billaut, 2006-03-20 Scheduling and multicriteria optimisation theory have been subject separately to numerous studies Since the last twenty years multicriteria scheduling problems have been subject to a growing interest However a gap between multicriteria scheduling approaches and multicriteria optimisation field exists This book is an attempt to collect the elementary of multicriteria optimisation theory and the basic models and algorithms of multicriteria scheduling It is composed of numerous illustrations algorithms and examples which may help the reader in understanding the presented concepts This book covers general concepts such as Pareto optimality complexity theory and general method for multicriteria

optimisation as well as dedicated scheduling problems and algorithms just in time scheduling flexibility and robustness single machine problems parallel machine problems shop problems etc The second edition contains revisions and new material
