circuits Nondideal op amp characteristics Specialized devices *Design of High-Performance CMOS Voltage-Controlled Oscillators* Liang Dai, Ramesh Harjani, 2012-10-31 *Design of High Performance CMOS Voltage Controlled Oscillators* presents a phase noise modeling framework for CMOS ring oscillators. The analysis considers both linear and nonlinear operation. It indicates that fast rail to rail switching has to be achieved to minimize phase noise. Additionally, in conventional design, the flicker noise in the bias circuit can potentially dominate the phase noise at low offset frequencies. Therefore, for narrow bandwidth PLLs, noise up conversion for the bias circuits should be minimized. We define the effective Q factor Q_{eff} for ring oscillators and predict its increase for CMOS processes with smaller feature sizes. Our phase noise analysis is validated via simulation and measurement results. The digital switching noise coupled through the power supply and substrate is usually the dominant source of clock jitter. Improving the supply and substrate noise immunity of a PLL is a challenging job in hostile environments such as a microprocessor chip where millions of digital gates are present. *Design and Analysis 2.4 GHz Voltage-Controlled Oscillator (VCO) for Low-Phase Noise* Muhammad Fakhrulrazi Mohamad Fadzil, 2024. This project's scope is centred around the meticulous design and optimization of a Voltage Controlled Oscillator (VCO) with the specific target of achieving a stable oscillation frequency of 2.4 GHz. To realize this goal, the VCO will be meticulously crafted utilizing 0.35 μ m CMOS technology, which offers a robust foundation for integrated circuit design. A key emphasis of this design endeavor is the implementation of advanced filtering techniques to effectively eliminate extraneous noise sources, ultimately leading to improved phase noise performance. By harnessing the capabilities of CMOS technology and applying precise filtering strategies, this project seeks to deliver a 2.4 GHz VCO that not only meets the frequency requirement but also excels in minimizing phase noise, thereby enhancing its suitability for demanding wireless communication applications. The methodology employed in this study exclusively utilizes simulation techniques without involving any physical fabrication processes. Therefore, all results and findings herein are derived solely from computational simulations. It is essential to emphasize that no physical prototypes or fabricated components were utilized during this research. This research concentrates exclusively on design with simulation as the primary methodological approach. The scope of this study imposes constraints on physical fabrication processes. Consequently, the outcomes are derived solely from simulations conducted within the AWR Cadence software environment. While acknowledging the potential variance between simulated results and those obtained through physical implementation, it is worth noting that the simulations are expected to closely approximate the performance of the designed system under real-world conditions. However, it is imperative to recognize that the findings are contingent upon the virtual representation within the software, thereby. *Distributed Voltage Controlled Oscillator* Sunil Modur Nagabhushana, 2001 *Oscillator Circuits* Rudolf F. (VCO) in Phase Locked Loop (PLL) Vern Shyn Khaw,2005 **A Voltage Controlled Oscillator/Mixer** Marion C. Bartlett,Raymond C. Johnson,FLORIDA UNIV GAINESVILLE ENGINEERING AND INDUSTRIAL EXPERIMENT STATION.,1974 A new technique for product mixing of an input signal with a locally generated reference by using a voltage controlled oscillator VCO is described and verified both mathematically and experimentally The technique consists of frequency modulating the oscillator with the signal voltage It is shown that for low index frequency modulation by the signal the sidebands of the oscillator produced by the signal are equivalent to those of a multiplicative mixer with a gain of approximately unity The technique is particularly useful for synchronized IF correlator systems where a function generator can serve to generate the modulation waveform and act as a coherent detector simultaneously Modified author abstract
