

A-2 MEASUREMENT AND UNCERTAINTY ANALYSIS (Manual)

OBJECTIVES:

- 1) To understand standard error determination
- 2) To understand standard error propagation
- 3) To understand determination of standard deviation/standard error
- 4) To understand standard uncertainty analysis in a system
- 5) To understand significant figures and their correct use
- 6) To know what is standard form

INTRODUCTION:

In your laboratory work in this physics course you will observe that when you make repeated measurements of a physical quantity the measurements do not exactly agree. These slight physical variations are made insignificant in the following systematic manner: the measured value is considered to be the arithmetic mean value. It is by using this for representing (instead the individual) of the results that the errors become about half as large as the apparent (or individual) uncertainty. Consequently, several data analysis techniques have been developed.

Reasons of errors and uncertainties:

There are two general categories of possible errors and uncertainties:

Systematic errors: are the type of errors that cannot be avoided. The following diagram may be able to give an insight to a reason that is not systematic. Imagine you have a system with two sources of being systematic as shown in the diagram. It is better to be able to avoid systematic errors. It is a problem to get rid of them. It is better to be able to avoid them. It is better to be able to avoid them. It is better to be able to avoid them.

Random errors: are errors that are caused by the random nature of the system. These errors are not avoidable. They are caused by the random nature of the system. They are caused by the random nature of the system. They are caused by the random nature of the system.

In your work in this physics course you will observe that all of these errors can be avoided. However, the uncertainty in the measurements is unavoidable. It is unavoidable.

Accuracy versus Precision

In physics, accuracy and precision are two different concepts. Accuracy is the closeness of the measured value to the true value. Precision is the closeness of the measured value to the measured value.

Accuracy and precision are two different concepts. Accuracy is the closeness of the measured value to the true value. Precision is the closeness of the measured value to the measured value.

$$\text{Accuracy} = \frac{\text{measured value} - \text{true value}}{\text{measured value}}$$

Precision is the closeness of the measured value to the measured value. It is the closeness of the measured value to the measured value.

Grasman,G. van Straten,2012-12-06 Researchers in the natural sciences are faced with problems that require a novel approach to improve the quality of forecasts of processes that are sensitive to environmental conditions Nonlinearity of a system may significantly complicate the predictability of future states a small variation of parameters can dramatically change the dynamics while sensitive dependence of the initial state may severely limit the predictability horizon Uncertainties also play a role This volume addresses such problems by using tools from chaos theory and systems theory adapted for the analysis of problems in the environmental sciences Sensitive dependence on the initial state chaos and the parameters are analyzed using methods such as Lyapunov exponents and Monte Carlo simulation Uncertainty in the structure and the values of parameters of a model is studied in relation to processes that depend on the environmental conditions These methods also apply to biology and economics For research workers at universities and semi governmental institutes for the environment agriculture ecology meteorology and water management and theoretical economists *Solutions Manual for Uncertainty Modeling and Analysis in Engineering and the Sciences* Bilal M.
