Sawaragi,1995-04-11 The science and technology of coastal and ocean engineering are closely related to harbour and fishery engineering because they share a common basic knowledge However whereas various publications of coastal engineering harbour engineering and ocean engineering have described just the knowledge in their own respective fields an interrelated and systematic presentation linking them together has yet to be attempted This book is the first attempt to systematically combine the fields of coastal ocean harbour and fishery engineering from an engineering viewpoint backed by hydrodynamics Understanding the interaction of waves with structures and sediment and predicting the associated responses of interest underlie nearly every problem in coastal and ocean engineering This is precisely the goal of this book Although primarily intended for use as a special textbook for graduate students and senior practising engineers it is hoped that this book will also serve as a useful reference and assist in the further development of this field With these objectives in mind each chapter deals with important problems to be solved in the near future The references included in

Shore Wave Modulation Due to Infragravity Waves in the Nearshore Zone, with Applications Saad M. M. Abdelrahman, 1986 The omni present low frequency wave motion 30 300 sec contains a substantial fraction of the total wave energy inside the surf zone A more complete description of nearshore wave processes considers incident short period waves superposed on and interacting with long standing waves The wind waves are modulated in amplitude wavenumber and direction due to relatively slowly varying depth changes caused by the long waves The energy in the wind wave band is enhanced by side band growth at the sum and difference frequencies of short and long waves order 15% at the shoreline The modulation is identified in the analysis of field data as a positive correlation between the long waves and the wind wave envelope near the shoreline Considering oblique incident waves a steady longshore current showing a non vanishing current at the shoreline is found as a result of the non linear interaction between monochromatic incident and infragravity waves An analytical solution describing the unsteadiness of the longshore current is developed Keywords include Infragravity Longshore Current Sediment transport and Surf zone dynamics Theses *Guidelines for the Design and Construction of Flexible Revetments Incorporating Geotextiles in Marine Environments*, 1992
