Abstract

Tropical regions receive a significant part of the traveling population. It is very important that health professionals are familiar with the main tropical skin diseases and able to advise patients appropriately. This article reviews the main tropical diseases of travelers, with an emphasis on diagnosis, management, and prevention. Among others, cutaneous larva migrans, myiasis, tungiasis, Chagas disease, Dengue fever, African trypanosomiasis, filariasis, and leishmaniasis are discussed. Increasing awareness among travelers and health care professionals can help reduce morbidity and mortality. Continued research on new drugs and vaccines is needed to reduce the risks of tropical diseases.

KEYWORDS

cutaneous larva migrans, diseases of travelers, leishmaniasis, myiasis, tropical diseases

1 | INTRODUCTION

In 2015, it is estimated that 1.2 billion people traveled around the world, and the number of international tourist arrivals is expected to increase by 3.3% a year by 2030 (United Nations World Tourism Organization, 2015). Along with the increasing number of travelers, a significant growth of travel-related illnesses including dermatologic problems is observed (Korzeniewski, Juszczak, & Jerzemowski, 2015). In tropical regions, travelers are exposed to a much larger number of insects (vectors of arthropod-borne diseases) than in temperate climate areas as well as contaminated soil and water (Korzeniewski et al., 2015). Trips to exotic destinations and tropical regions expose the travelers to risks of contracting new illness; therefore, preventive measures are required to reduce these risks.

A research study that was conducted by Freedman et al. included 17,353 travelers and concluded that skin disorders are the third most recurrent health problem that international travelers face when traveling to developing countries, only rating behind fever and acute diarrhea (Freedman, Chen, & Kozarsky, 2016). Skin diseases may affect up to 8% of travelers (Pittel & Sethi, 2009). Preventive measures can be provided through travel protocols. People who plan to travel to other countries are advised to ask their health care providers for information about preventive interventions that can be obtained by following protocols such as those reported in Freedman's review. Dermatologists and general practitioners should be prepared to prevent,

diagnose and treat tropical dermatological diseases in travelers, and this review aims to assist in this task. Resources and relevant sites on tropical diseases are listed on Table 1.

2 | VIRAL EXANTHEMS

In a study by Hocheneder et al. (2008), Chikungunya (35%) and Dengue (26%) were the major of etiologies of febrile exanthem.

2.1 | Dengue fever

Dengue fever is caused by a flavivirus that has five serotypes. It is transmitted by the *Aedes* mosquito, particularly *A. aegypti*, an insect with an incubation period that varies from 4 to 10 days. It is an emergency disease and according to World Health Organization (WHO), over half of the world's population is at risk of contracting the virus that infects approximately 100 million people per year (Ulinick, 2000; Ugon, 2005; Schwartz, Mendelson, & Sidi, 1996; Tsai, 2002).

2.2 | Diagnosis

The diagnosis is made through the clinical and laboratory features, which must include fever and two of the following: severe headache, retro-ocular pain, gastrointestinal distress, myalgia, arthralgia, prostration, skin rash, and leukopenia. Over 50% of patients develop facial erythema, a macular, rubella-like exanthem, and petechiae. Dengue fever presents with one or more of the following manifestations: severe abdominal pain, persistent vomiting, fluid
