Romanowicz, 2012-12-06 Over the past two decades technologies for microsystems fabrication have made considerable progress This has made possible a large variety of new commercial devices ranging for example from integrated pressure and acceleration microsensors to active micromirror arrays for image projection In the near future there will be a number of new devices which will be commercialized in many

application areas The field of microsystems is characterized by its wide diversity which requires a multidisciplinary approach for design and processes as well as in application areas Although there is a common technological background derived from integrated circuits it is clear that microsystems will require additional application specific technologies Since most microsystem technologies are based on batch processing and dedicated to mass production prototyping is likely to be an expensive and time consuming step It is recognized that standardization of the processes as well as of the design tools will definitely help reduce the entry cost of microsystems This creates a very challenging situation for the design modeling and simulation of microsystems Methodology for the Modeling and Simulation of Microsystems is the first book to give an overview of the problems associated with modeling and simulation of microsystems It introduces a new methodology which is supported by several examples It should provide a useful starting point for both scientists and engineers seeking background information for efficient design of microsystems

Fault-Tolerant Real-Time Systems Stefan Poledna, 2007-11-23 Real time computer systems are very often subject to dependability requirements because of their application areas Fly by wire airplane control systems control of power plants industrial process control systems and others are required to continue their function despite faults Fault tolerance and real time requirements thus constitute a kind of natural combination in process control applications Systematic fault tolerance is based on redundancy which is used to mask failures of individual components The problem of replica determinism is thereby to ensure that replicated components show consistent behavior in the absence of faults It might seem trivial that given an identical sequence of inputs replicated computer systems will produce consistent outputs Unfortunately this is not the case The problem of replica non determinism and the presentation of its possible solutions is the subject of Fault Tolerant Real Time Systems The Problem of Replica Determinism The field of automotive electronics is an important

application area of fault tolerant real time systems Systems like anti lock braking engine control active suspension or vehicle dynamics control have demanding real time and fault tolerance requirements These requirements have to be met even in the presence of very limited resources since cost is extremely important Because of its interesting properties Fault Tolerant Real Time Systems gives an introduction to the application area of automotive electronics The requirements of automotive electronics are a topic of discussion in the remainder of this work and are used as a benchmark to evaluate solutions to the problem of replica determinism
