Theory Of Solitons The Inverse Scattering Method Monographs In Contemporary Mathematics:

Theory of Solitons S. Novikov, S.V. Manakov, L.P. Pitaevskii, V.E. Zakharov, 1984-05-31 **Arithmetic of Algebraic Curves** Serguei A. Stepanov, 1994-12-31 Author S A Stepanov thoroughly investigates the current state of the theory of Diophantine equations and its related methods Discussions focus on arithmetic algebraic geometric and logical aspects of the problem Designed for students as well as researchers the book includes over 250 exercises accompanied by hints instructions and references Written in a clear manner this text does not require readers to have special knowledge of modern methods of algebraic geometry *Nonstationary Resonant Dynamics of Oscillatory Chains and Nanostructures* Leonid I. Manevitch, Agnessa Kovaleva, Valeri Smirnov, Yuli Starosvetsky, 2017-07-25 This book suggests a new common approach to the study of resonance energy transport based on the recently developed concept of Limiting Phase Trajectories LPTs presenting applications of the approach to significant nonlinear problems from different fields of physics and mechanics In order to highlight the novelty and perspectives of the developed approach it places the LPT concept in the context of dynamical phenomena related to the energy transfer problems and applies the theory to numerous problems of practical importance This approach leads to the conclusion that strongly nonstationary resonance processes in nonlinear oscillator arrays and nanostructures are characterized either by maximum possible energy exchange between the clusters of oscillators coherence domains or by maximum energy transfer from an external source of energy to the chain The trajectories corresponding to these processes are referred to as LPTs The development and the use of the LPTs concept are motivated by the fact that non stationary processes in a broad variety of finite dimensional physical models are beyond the well known paradigm of nonlinear normal modes NNMs which is fully justified either for stationary processes or for nonstationary non resonance processes described exactly or approximately by the combinations of the non resonant normal modes Thus the role of LPTs in understanding and analyzing of intense resonance energy transfer is similar to the role of NNMs for the stationary processes The book is a valuable resource for engineers needing to deal effectively with the problems arising in the fields of mechanical and physical applications when the natural physical model is quite complicated At the same time the mathematical analysis means that it is of interest to researchers working on the theory and numerical investigation of nonlinear oscillations *Finitely Additive Measures and Relaxations of Extremal Problems* A.G. Chentsov, 1996-09-30 This monograph constructs correct extensions of extremal problems including problems of multicriteria optimization as well as more general cone optimization problems The author obtains common conditions of stability and asymptotic nonsensitivity of extremal problems under perturbation of a part of integral restrictions for finite and infinite systems of restrictions Features include individual chapters on nonstandard approximation of finitely additive measures by indefinite integrals and constructions of attraction sets Professor Chentsov illustrates abstract settings by providing examples of problems of impulse control mathematical programming and stochastic optimization **Rogue and Shock Waves in Nonlinear Dispersive**

Media Miguel Onorato, Stefania Resitori, Fabio Baronio, 2016-09-19 This self contained set of lectures addresses a gap in the literature by providing a systematic link between the theoretical foundations of the subject matter and cutting edge applications in both geophysical fluid dynamics and nonlinear optics Rogue and shock waves are phenomena that may occur in the propagation of waves in any nonlinear dispersive medium Accordingly they have been observed in disparate settings as ocean waves in nonlinear optics in Bose Einstein condensates and in plasmas Rogue and dispersive shock waves are both characterized by the development of extremes for the former the wave amplitude becomes unusually large while for the latter gradients reach extreme values Both aspects strongly influence the statistical properties of the wave propagation and are thus considered together here in terms of their underlying theoretical treatment This book offers a self contained graduate level text intended as both an introduction and reference guide for a new generation of scientists working on rogue and shock wave phenomena across a broad range of fields in applied physics and geophysics **Asymptotic Methods in**

Singularly Perturbed Systems Evgeniï Frolovich Mishchenko, 1994 Furthers the construction of a full asymptotic theory of relaxation oscillations begun by earlier authors and contains the results of a number of new problems especially in systems of parabolic partial differential equations Considers a singularly perturbed system to be one in which as the parame

Integrable Geodesic Flows on Two-Dimensional Surfaces A.V. Bolsinov, A.T. Fomenko, 2000 From Moscow State University Bolsinov computer methods and Fomenko differential geometry present a new approach to the qualitative analysis of the particular type of geodesic flow of Riemannian metrics on manifolds based on the theory of topological classification of integrable Hamiltonian systems They begin by introducing the qualitative theory of integrable Hamiltonian systems then discuss the class of integrable geodesic flows on two dimensional surfaces from both the classical and contemporary perspectives They classify the flows according to equivalence relations such as isometry the Liouville equivalence the smooth and continuous trajectory equivalence and the geodesic equivalence They also explain the new technique that makes such classification possible Many of their results have not been published before The Russian original is *Geometriia i topologiia integriruemykh geodezicheskikh potokov na poverkhnostiakh* Annotation copyrighted by Book News Inc Portland OR *The Geometrical Study of Differential Equations* Joshua Allensworth Leslie, Thierry P. Robart, 2001 This volume contains papers based on some of the talks given at the NSF CBMS conference on The Geometrical Study of Differential Equations held at Howard University Washington DC The collected papers present important recent developments in this area including the treatment of nontransversal group actions in the theory of group invariant solutions of PDEs a method for obtaining discrete symmetries of differential equations the establishment of a group invariant version of the variational complex based on a general moving frame construction the introduction of a new variational complex for the calculus of difference equations and an original structural investigation of Lie Backlund transformations The book opens with a modern and illuminating overview of Lie's line sphere correspondence and concludes with several interesting open problems arising from symmetry analysis of

PDEs It offers a rich source of inspiration for new or established researchers in the field This book can serve nicely as a companion volume to a forthcoming book written by the principle speaker at the conference Professor Niky Kamran to be published in the AMS series CBMS Regional Conference Series in Mathematics **Important Developments in Soliton Theory** A.S.
